OPRI2-4239 TE cooled Integrated Optopair

Spectral Responses of Photodetector and Light Emitters with narrow-band filters

The integrated device consists of two solid state light emitters (light sources) and one photodetector.

Each Light Emitter has built-in narrow band interference filters: one (first emitter) filter is adjusted to absorption line of tested material (base channel), the another (second emitter) one - is far from the absorption band (reference channel).

Detector is the broad-band PbSe photoresistor.

The light emitters and the detector are mounted at the same plane at cold side of miniature thermoelectric (TE) cooler and integrated in the single housing.

TE cooler is used for cool down and fine temperature stabilization of the detector and emitters.

The semiconductor Light Emitters are optimized for operation of the Photodetector.
