## **Introduction**

This manual describes the instruction set of the nX-4/250 core and nX-4/300 core, which is designed for use as the CPU core for the original OKI CMOS 4-bit microcontroller.

This manual is designed on the basis of the nX-4/250 core and nX-4/300 core basic architecture. The basic architecture of these constitutes the most important functional specifications of the nX-4/250 core and nX-4/300 core. Depending on the model you are using the actual supported memory capacity may be a subset of the basic architecture. Please refer to the individual user's manual for such information.

The following manuals related to the product line-up built around the nX-4/250 core and nX-4/300 core are available.

Please refer to them for additional information.

- MSM63XXX User's Manual  
Hardware description
- ASM63KN Cross-assembler User's Manual  
Description of assembler operation and language specifications
- EASE63XXX User's Manual  
Emulator hardware description
- SID63K Operation Manual  
Debugger command description

This manual consists of two chapters.

Chapter 1 discusses the nX-4/250 core and nX-4/300 core basic architecture, beginning with explanations of the major resources used by the program, such as registers and memory, and then discussing addressing modes.

Chapter 2 explains the functions of each instruction, covering instruction function, their detailed action, and the instruction codes. Instruction descriptions are arranged in alphabetical order to serve as a reference.

# ***Chapter 1***

## **ARCHITECTURE**

---

This chapter describes the basic architecture of the nX-4/250 core and nX-4/300 core. The basic architecture is the most significant functional specification of the nX-4/250 core and nX-4/300. All microcontrollers using this core will have the same function as the basic architecture, or a subset thereof. This chapter covers the objectives of this document and its composition.

## 1. OVERVIEW

The nX-4/250 core and nX-4/300 core instruction set consist of 440/450 instructions.

The memory spaces are divided into a 16-bit width program memory space, a 4-bit width data memory space, and external 8-bit width memory.

The program counter save stack (call stack) for subroutine call or interruption and register save stack (register stack) are prepared separately from memory space.

The nX-4/250 core is a downward version of the nX-4/300 core.

The differences between them are shown below.

**Table 1-1 Differences between nX-4/250 Core and nX-4/300 Core**

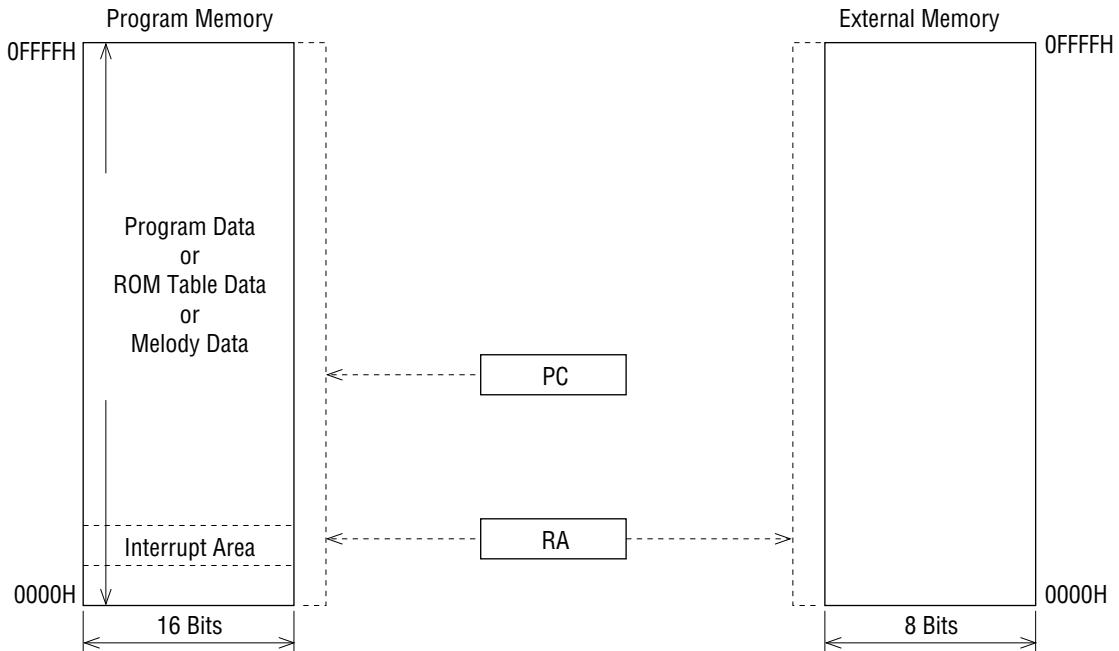

| Core     | MMOV instruction | BMOV instruction | FCLR FLAG instruction | FSET FLAG instruction |
|----------|------------------|------------------|-----------------------|-----------------------|
| nX-4/250 | Not provided     | Not provided     | Not provided          | Not provided          |
| nX-4/300 | provided         | provided         | provided              | provided              |

## 2. CPU RESOURCES AND PROGRAMMING MODEL

This section describes the configuration of the CPU resources used in programming, such as registers and memory, along with their roles.

Figures 1-1 to 1-2 show the relationship between program memory space, external memory, data memory and registers.

Figures 1-3 show the relationship between these memory spaces and stack registers.

**Fig. 1-1 Relationship between Program Memory, External Memory, and Registers**

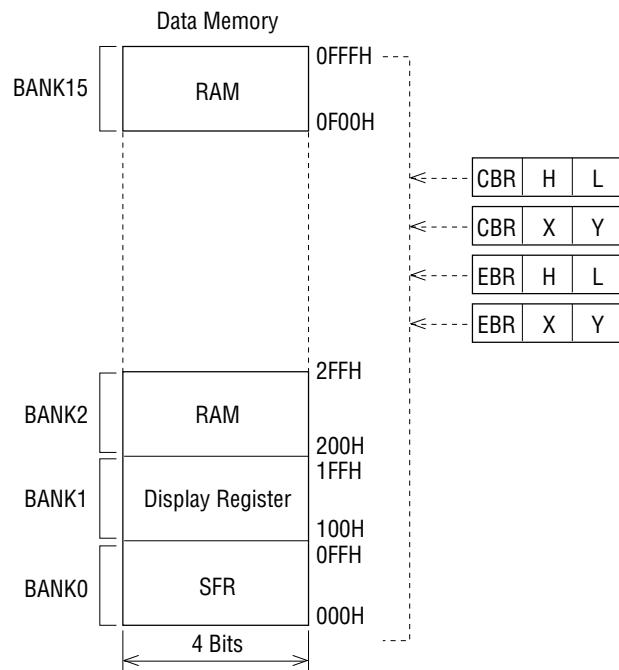

Fig. 1-2 Relationship between Data Memory and Registers

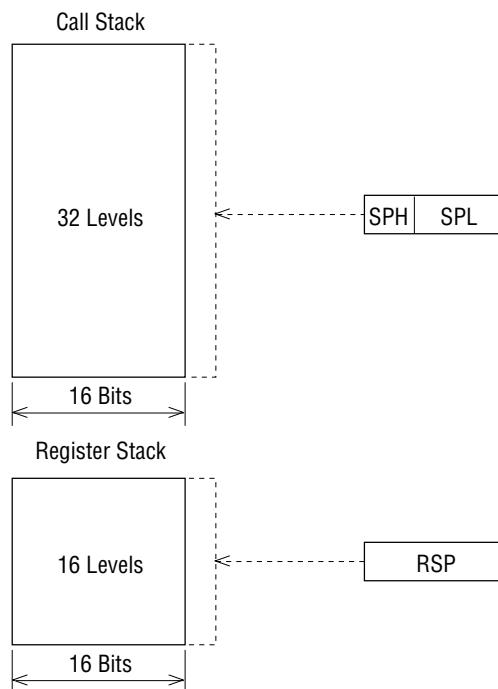

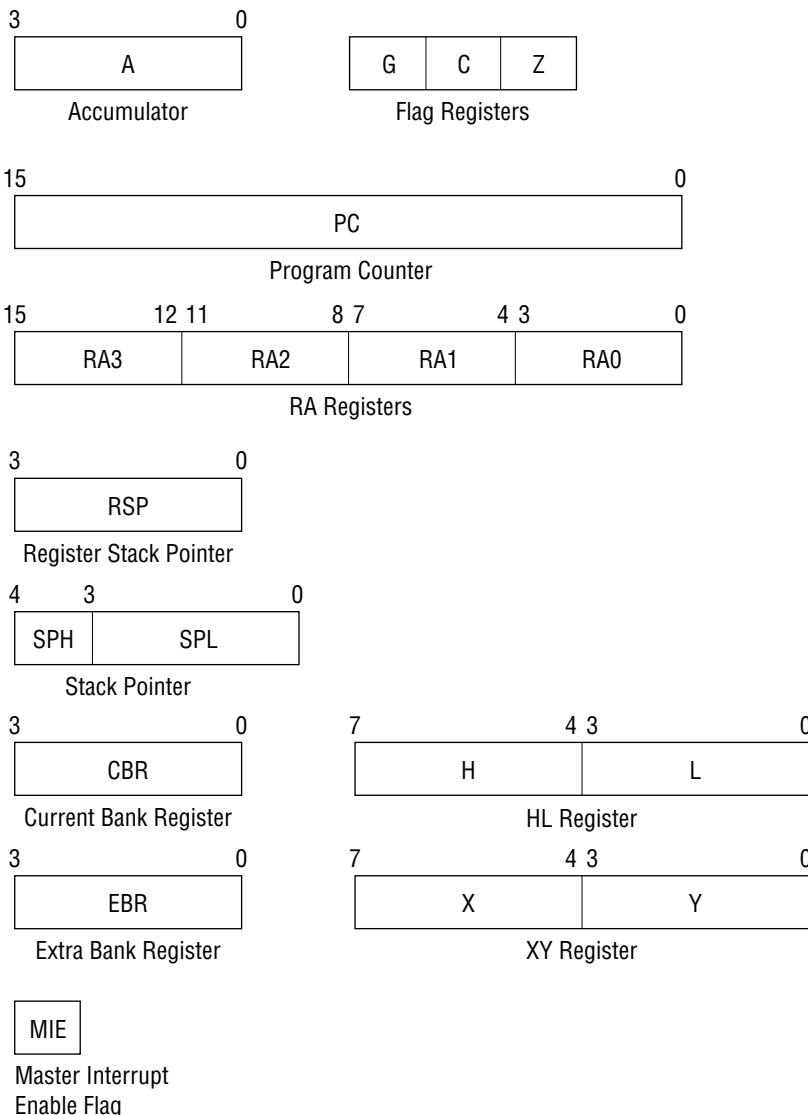

Fig. 1-3 Relationship between Stacks and Registers

## 2.1 Registers

The nX-4/250 core and nX-4/300 core adopt a processing method that uses primarily accumulators and registers. The register set uses the programming model, with data memory addresses stored in the HL register, XY register, current bank register (CBR), extra bank register (EBR), and external memory and program memory addresses in the RA register. In addition registers are provided to control program flow, flags and memory.

Figures 1-4 show register configurations.

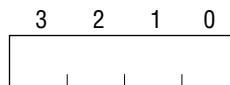

**Fig. 1-4 Register Configuration**

### 2.1.1 Accumulator (A)

Accumulator (A) is a critical register for arithmetic operations.

The accumulator is initialized to zero at reset. In the event that accumulator contents must be saved when an interrupt is generated or at other times, the PUSH HL instruction is used to save the value to the register stack. The register is restored with the POP HL instruction.

**Fig. 1-5 Accumulator (A)**

### 2.1.2 Flag registers

The flag register consists of three flags: the carry flag (C), the zero flag (Z) and the G flag (G). In the event that flag register contents must be saved when an interrupt is generated or at other times, the PUSH HL instruction is used to save the value to the register stack. The register is restored with the POP HL instruction.

**Fig. 1-6 Flag Registers**

#### 2.1.2.1 Carry flag (C)

The carry flag (C) is a 1-bit flag, and is used to load the carry for an additional instruction or the borrow for a subtraction instruction.

The carry flag is initialized to zero at reset.

#### 2.1.2.2 Zero flag (Z)

The zero flag (Z) is a 1-bit flag, and is set to "1" when the content of the accumulator (A) is set to "0H".

It is cleared to "0" when the content of the accumulator (A) is set to any value other than "0H". The zero flag is initialized to zero at reset.

#### 2.1.2.3 G flag (G)

The G flag is a 1-bit flag. This flag is set to "1" when the HL register, XY register, or RA register overflows as a result of execution of an increment instruction and is cleared to "0" when an overflow does not occur.

The HL register or XY register is incremented when an indirect addressing instruction with post increment is executed or when an increment instruction is executed for the HL register or XY register. The RA register is incremented when an increment instruction is executed.

### 2.1.3 Master interrupt enable flag (MIE)

The master interrupt enable flag (MIE) is the flag used to control enable/disable for maskable interrupts. When set to "1" maskable interrupts are enabled, and when cleared to "0" maskable interrupts are disabled.

If a maskable interrupt is received, the MIE flag is cleared to "0", and then restored to "1" through the execution of the maskable interrupt return instruction (RTI instruction). Instruction execution in the maskable interrupt processing routine can set to the MIE flag to "1" to make possible multi-level interrupt processing.

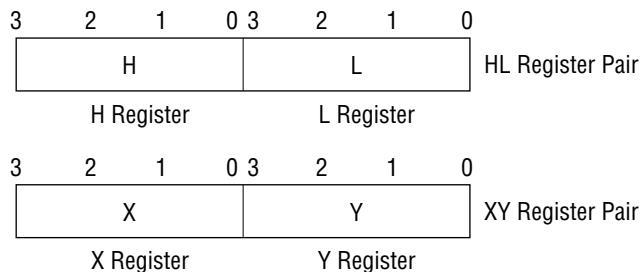

MIE flag set and clear are implemented with the "EI" and "DI" instructions, which are only used for MIE flag operations.

The MIE flag is initialized to zero at reset. The MIE flag is allocated to address 0FFH of the special function register (SFR).

### 2.1.4 H register, L register, X register, Y register

The H register, L register, X register and Y register are used as working registers during program processing. The H and L registers are used as a register pair in the data memory indirect addressing mode, as are the X and Y registers.

All four registers are initialized to zero at reset. In the event that register contents must be saved when an interrupt is generated or at other times, the PUSH HL or PUSH XY instruction is used to save the value to the register stack. The register is restored with the POP HL or POP XY instruction. The H, L, X and Y registers are allocated to addresses 0F9H through 0FCH of the special function register (SFR).

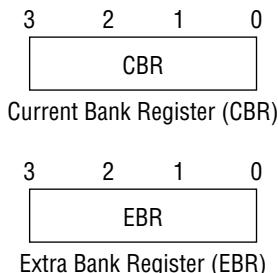

**Fig. 1-7 H, L, X, and Y Registers**

### 2.1.5 Current bank register (CBR), extra bank register (EBR)

The current bank register (CBR) and extra bank register (EBR) are used for data memory space bank specification.

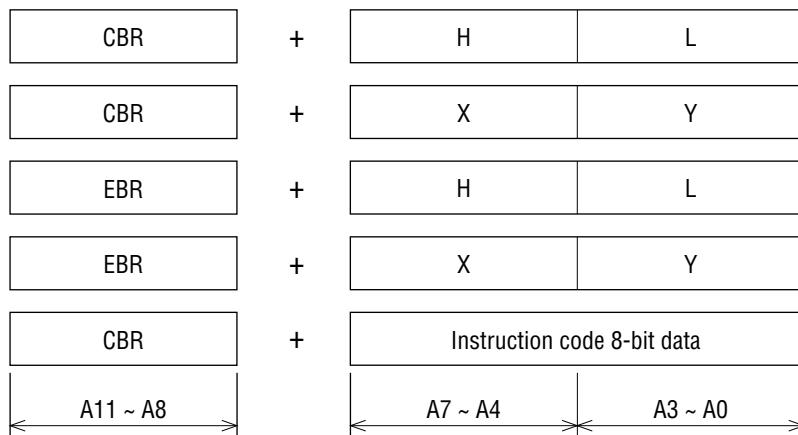

CBR and EBR are initialized to zero at reset. In the event that register contents must be saved when an interrupt is generated or at other times, the PUSH XY instruction is used to save the value to the register stack. The register is restored with the POP XY instruction. The CBR and EBR are allocated to addresses 0FDH through 0FEH of the special function register (SFR).

**Fig. 1-8 Current Bank Register and Extra Bank Register**

CBR and EBR are used in combination with the HL and XY registers for indirect addressing of data memory. CBR is used in combination with the 8-bit data in the instruction code for direct addressing within the current bank.

Fig. 1-9 indicates the register combinations used.

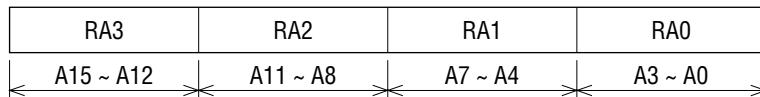

**Fig. 1-9 Register Combinations**

A11 to A0 indicate data memory (max. 4K nibbles ) address.

### 2.1.6 RA register (RA3, RA2, RA1, RA0)

The RA registers are used for program memory indirect addressing (ROM table reference instruction) and external memory indirect addressing (external memory transfer instruction). Fig. 1-10 indicates the address configuration for the RA registers.

**Fig. 1-10 Address Configuration for Registers RA3 through RA0**

When used for ROM table reference instructions, A15 through A0 indicate a maximum of 64K bytes of program memory addresses.

When used for external memory transfer instructions, A15 through A0 indicate a maximum of 64K bytes of external memory addresses.

RA3 through RA0 are allocated to addresses 0F2H through 0F5H of the special function register (SFR).

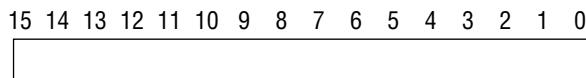

The RA registers are initialized to zero at reset.

### 2.1.7 Program counter (PC)

The program counter (PC) is the counter used to store the address of the program code to be executed next. The PC bit length is 16 bits, which means it can specify an address within 64K byte program memory space.

The PC is increased immediately after the program code is fetched from program memory, and this repetition creates program flow. For a branch instruction the new program code address is set to the PC.

The PC is initialized to zero at reset. When an interrupt is generated the execution restart address is automatically saved to the call stack. This value can be restored to the PC through the RTI instruction.

**Fig. 1-11 Program Counter**

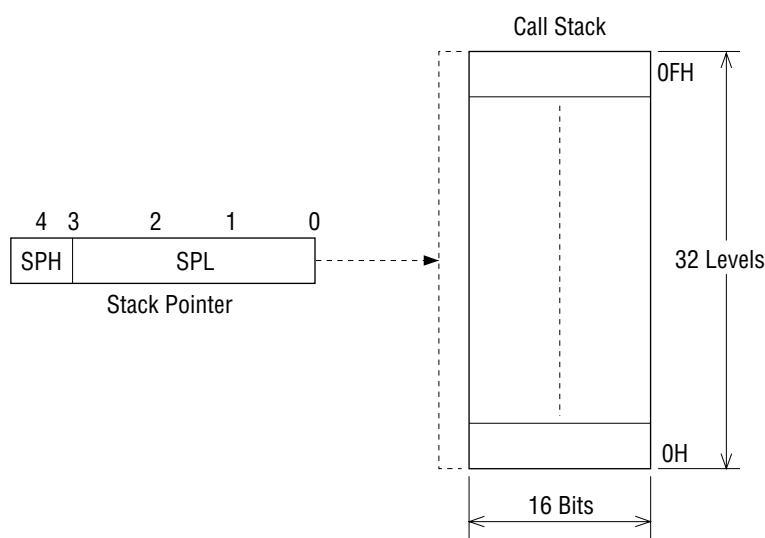

### 2.1.8 Stack pointer (SP or SPH/SPL)

The stack pointer (SP or SPH/SPL) is a pointer indicating the head address of the call stack, which is used for saving program counters at subroutine calls and interrupt.

The stack pointer is a 5-bit up/down counter, counting up at stack save and down at stack restore. The call stack is 16 bits wide, and uses one level for PC save. It has a maximum of 32 levels.

The stack pointer is initialized to zero at reset, and points to address "00H" in the call stack. The SPH/SPL are allocated to address "0F8H" and "0F7H", respectively, of the special function register (SFR). The stack pointer is a read-only register, and write is disabled.

Figs. 1-12 indicate the relation between the stack pointer (SP) and the call stack.

**Fig. 1-12 Relation between SPH/SPL and Call Stack**

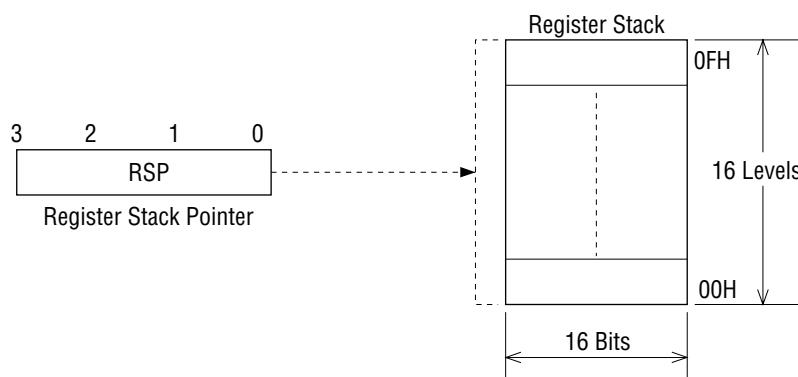

### 2.1.9 Register stack pointer (RSP)

The register stack pointer (RSP) is a pointer indicating the address of the register stack, used for saving various registers.

The RSP is a 4-bit up/down counter, counting up at stack save (PUSH instruction) and down at a stack restore (POP instruction). The register stack is 16 bits wide, and uses one level for register save. It has a maximum of 16 levels.

The RSP is initialized to zero at reset, and points to address “0H” in the call stack. The RSP is allocated to address “0F6H” of the special function register (SFR).

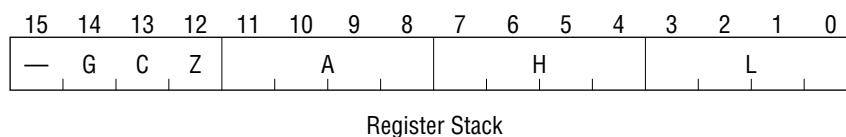

Fig. 1-13 indicates the relation between the RSP and the register stack.

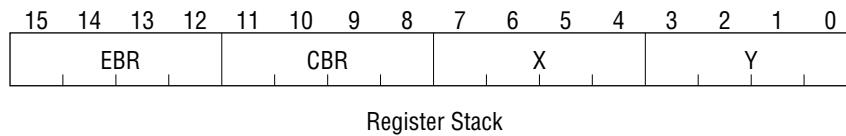

**Fig. 1-13 Relation between RSP and Register Stack**

The PUSH/POP instructions can be used to save various registers to the register stack, and restore them, as shown in Fig. 1-14.

PUSH HL and POP HL instruction execution

PUSH XY and POP XY instruction execution

**Fig. 1-14 Save/restore registers at PUSH/POP Instruction Execution**

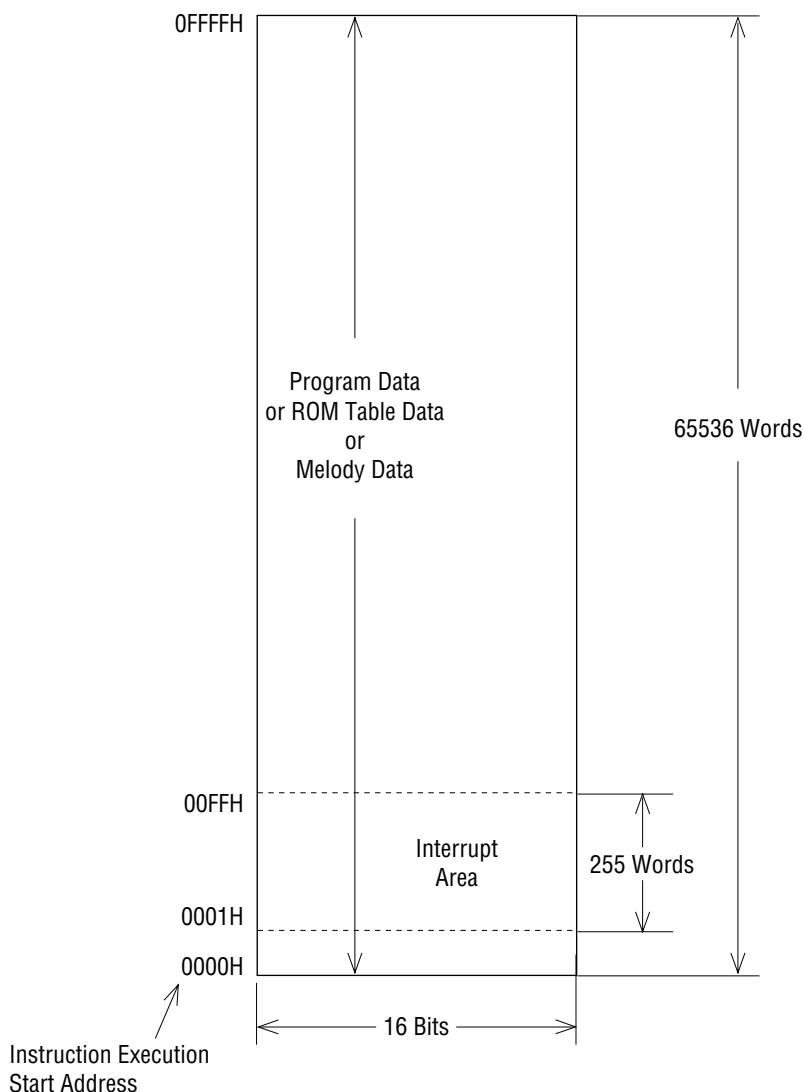

## 2.2 Memory spaces

The nX-4/250 core and nX-4/300 core memory spaces each consist of program memory space, data memory space and external memory space. This section discusses the structures of these memory spaces. Note that the program counter save stack (call stack) used at subroutine calls or interrupts, the address save stack (melody stack) for melody output and the register save stack (register stack) are separate from the memory space.

### 2.2.1 Program memory space

Program memory has a 16-bit data length with a 64 word capacity. The program memory space stores ROM data and melody data in addition to program data.

Figs. 1-15 indicate the program memory configurations.

**Fig. 1-15 Program Memory Configuration (nX-4/300)**

Address 0000H is the instruction execution start address when the system is reset.

Allocated in 0001H through 00FFH are interrupt process routine start addresses when an interrupt occurs. See the user's manual for your device because the allocation is different depending on the type of device.

ROM table data is transferred to data memory by a ROM table reference instruction.

Melody data defines musical scale, tone length, and end tone used in a melody circuit.

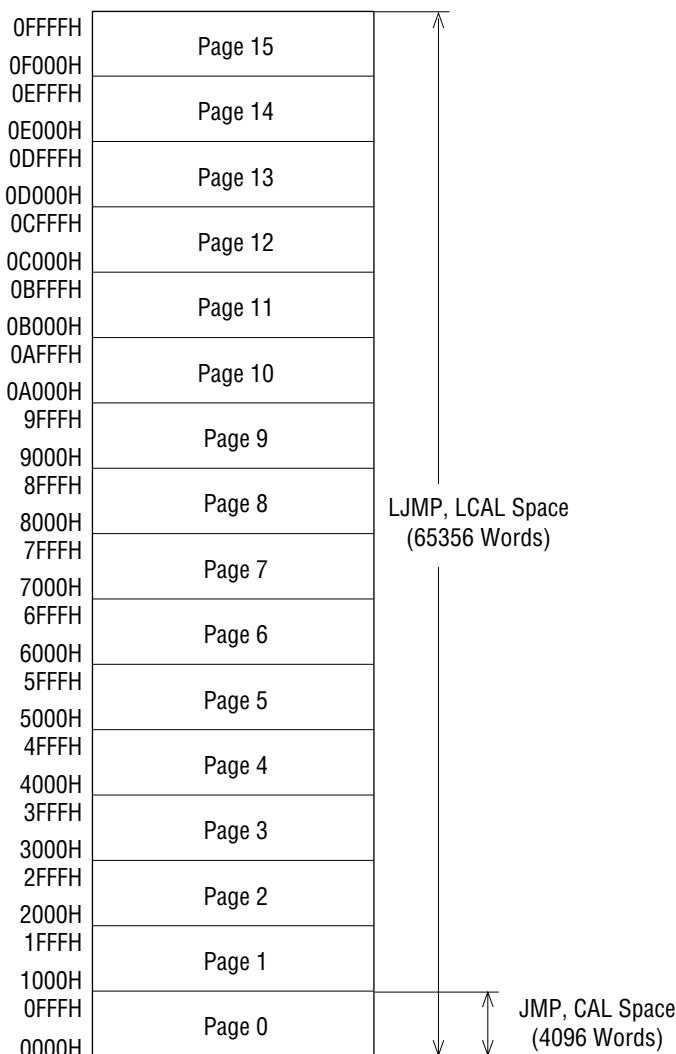

Melody data is automatically transferred to a melody circuit after its start address is indicated by a MSA instruction. This MSA instruction cannot be used for a device in which a melody circuit is not included.

In the program memory space, 1 page consists of 4K words.

The nX-4/250 core and nX-300 core has 16 pages.

The LJMP and LCAL instructions can access the entire program memory space, but the JMP and CAL instructions can access only a page internal.

The RA register indirect addressing instruction, PC relative addressing instruction, and PC based addressing instruction can access each page irrespective of the boundaries of pages

**Fig. 1-16 Pages in Program Memory Space (nX-4/300)**

## 2.2.2 Data memory space

Data memory space holds the data RAM and special function register (SFR).

As indicated in Fig. 1-17 below, the data memory consists of 16 banks, with each bank unit having 256 nibbles in size. BANK0 is assigned to SFR space, and bank1 to 15 (3480 nibbles) are assigned to data RAM.

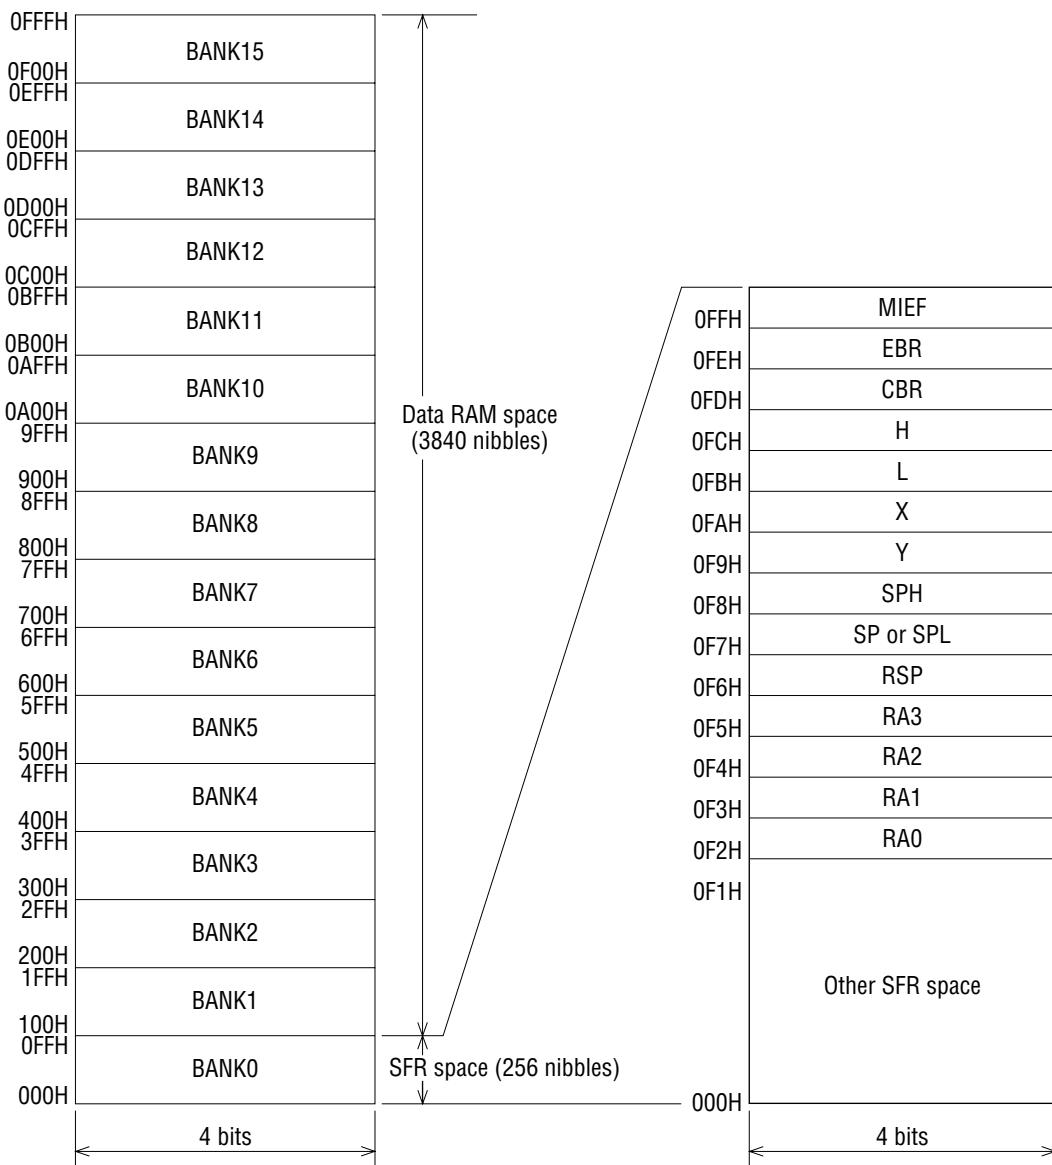

Fig. 1-17 Data Memory Space Configuration

### 2.2.2.1 SFR space

The 256-nibble SFR space from 000H to OFFH contains the special function register (SFR) used to control peripheral functions connected to the CPU core. The 0F2H to OFFH are allocated to CPU core registers as indicated in Table 1-2 below.

**Table 1-2 Register SFR Allocation**

| <b>Address</b> | <b>Register name</b>         | <b>symbol</b> | <b>Content</b> |           |           |           | <b>R/W</b> |
|----------------|------------------------------|---------------|----------------|-----------|-----------|-----------|------------|
|                |                              |               | <b>b3</b>      | <b>b2</b> | <b>b1</b> | <b>b0</b> |            |
| 0F2H           | RA0 register                 | RA0           | a3             | a2        | a1        | a0        | R/W        |

| 0FBH           | L register                   | L             | l3             | l2        | l1        | l0        | R/W        |
| 0FCH           | H register                   | H             | h3             | h2        | h1        | h0        | R/W        |
| 0FDH           | Current bank register        | CBR           | c3             | c2        | c1        | c0        | R/W        |
| 0FEH           | Extra bank register          | EBR           | e3             | e2        | e1        | e0        | R/W        |
| OFFH           | Master interrupt enable flag | MIEF          | —*             | —*        | —*        | MIE       | R          |

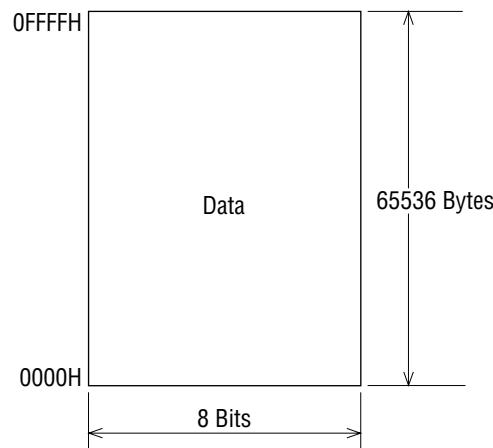

(Note) \* = reserved bit : Always reads "1". Write is disabled.

"R" indicates read-only and "R/W" indicates read and write are enabled.

### 2.2.3 External memory space

The external memory space has an 8-bit data length data space, allocated from address 00000H to address 0FFFFH.

The external memory space is configured as indicated in Fig. 1-18.

**Fig. 1-18 External Memory Space Configuration**

## 2.3 Addressing modes

Addressing modes are classified as indicated in Table 1-3.

**Table 1-3 Addressing Mode Classification**

| <b>Classification</b>            | <b>Content</b>                                   |
|----------------------------------|--|
| Register addressing modes        | Register direct                                  |
|                                  | Bit direct                                       |
|                                  | Immediate  |
| Data memory addressing modes     | Direct   |
|                                  | SFR bank internal direct                         |
|                                  | Current bank internal direct                     |
|                                  | HL register indirect                             |
|                                  | XY register indirect                             |
|                                  | Extra bank HL register indirect                  |
|                                  | Extra bank XY register indirect                  |
|                                  | Post-incremented HL register indirect            |
|                                  | Post-incremented XY register indirect            |
|                                  | Post-incremented extra bank HL register indirect |
|                                  | Post-incremented extra bank XY register indirect |
|                                  | Bit direct                                       |
|                                  | Bit indirect                                     |
| Program memory addressing modes  | 64 K word direct                                 |
|                                  | 4K word page internal direct                     |
|                                  | RA register indirect                             |
|                                  | PC relative                                      |
|                                  | PC based   |
| External memory addressing modes | RA register indirect                             |
|                                  | Direct   |

### 2.3.1 Register addressing mode

#### 2.3.1.1 Register direct addressing mode

Instructions can be used to directly set the accumulator (A), HL register, XY register, RA3 to RA0 registers, current flag register (CFR), extra bank register (EBR) and flag register (FLAG).

##### ■ Operand description

- A, H, L, X, Y, CBR, EBR, FLAG
- HL, XY, RA

##### ■ Description example

|         |                         |
|---------|-------------------------|
| INCB HL | ; Increment HL register |
|---------|-------------------------|

### 2.3.1.2 Bit direct addressing mode

Instructions can be used to perform bit operations on the zero flag (Z), carry flag (C) and G flag of the flag register (FLAG).

#### ■ Operand description

- Z, C, G

#### ■ Description example

|        |                    |
|--------|--------------------|
| FCLR C | ; Clear carry flag |
|--------|--------------------|

### 2.3.1.3 Immediate addressing mode

The numerical values in an instruction are directly treated as data.

#### ■ Operand description

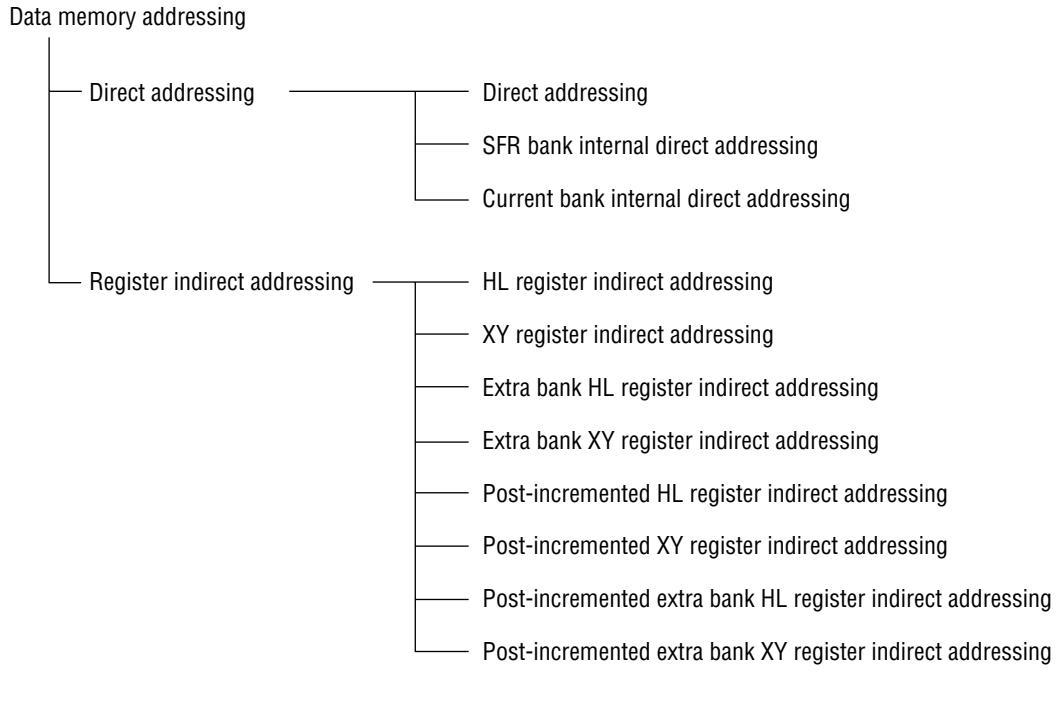

- #i

#### ■ Description example

|              |                                  |
|--------------|----------------------------------|
| MOV CBR, #4H | ; Write immediate data 4H to CBR |
|--------------|----------------------------------|

### 2.3.2 Data memory addressing modes

The following data memory addressing modes are supported:

The post-incremented indirect addressing mode can add +1 or +2 to the HL or XY register after instruction execution.

- For +1

In the 4-bit unit operation mode, the HL register or XY register is incremented by one after instruction execution. If the HL or XY register overflows as a result ( $HL = 0$  or  $XY = 0$ ), the G flag is set to “1”.

If there is no overflow, the G flag is cleared to “0”.

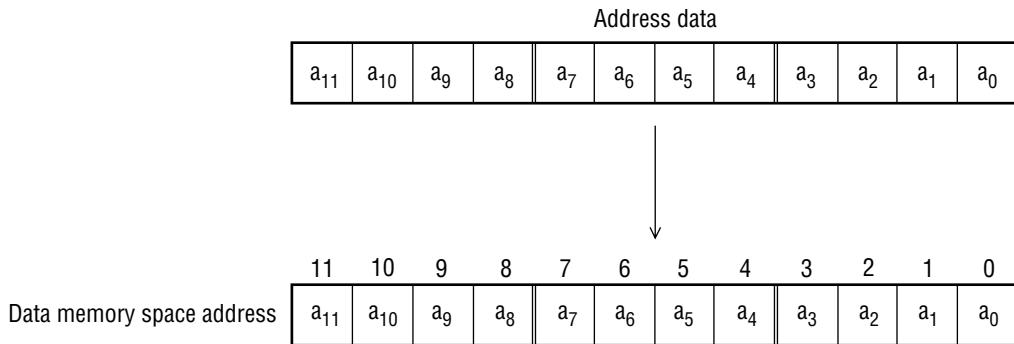

- For +2

In the 8-bit unit operation mode (ROM table reference instruction, external memory transfer instruction), the HL register or XY register is incremented by two after instruction execution. If the HL or XY register overflows as a result ( $HL > 0FFH$  or  $XY > 0FFH$ ), the G flag is set to “1”. If there is no overflow, the G flag is cleared to “0”.

[Note] The post-incremented indirect addressing mode should not be used for XY, HL, CBR, and EBR registers located in 0F9H to 0FEH of the SFR space.

### 2.3.2.1 Direct addressing mode

The data memory space address is directly specified by the 12-bit address data in the instruction code.

#### ■ Operand description

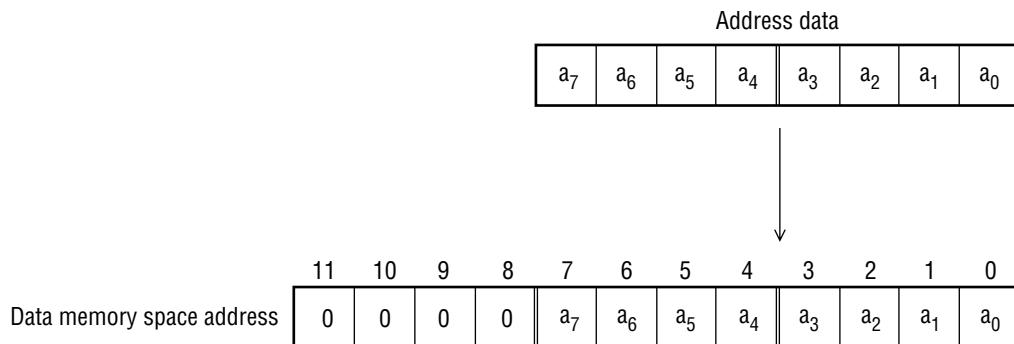

- direct

#### ■ Description example

MOV 326H, A ; Transfers accumulator content to address 26H of bank 3

### 2.3.2.2 SFR bank internal direct addressing mode

The data memory space SFR space (bank 0) is directly specified by the 8-bit address data in the instruction code.

#### ■ Operand description

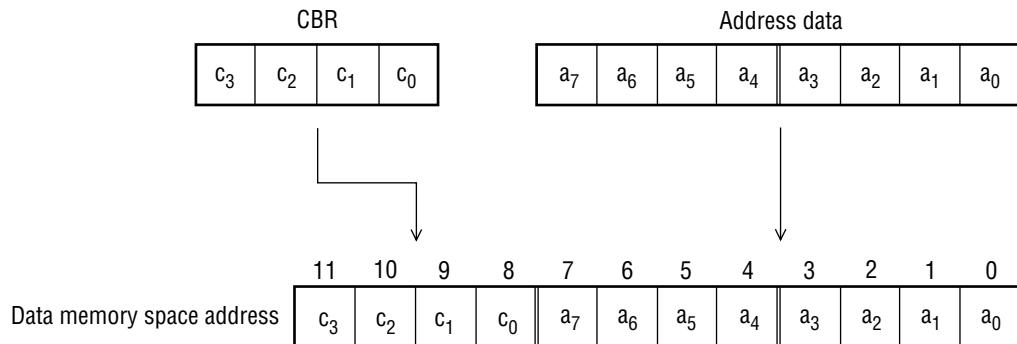

- sfr

#### ■ Description example

MOV 36H, #0CH ; Write immediate data 0CH to address 36H of the SFR (bank0)

### 2.3.2.3 Current bank internal direct addressing mode

The data memory space address is directly specified by the 8-bit address data in the current bank register (CBR).

#### ■ Operand description

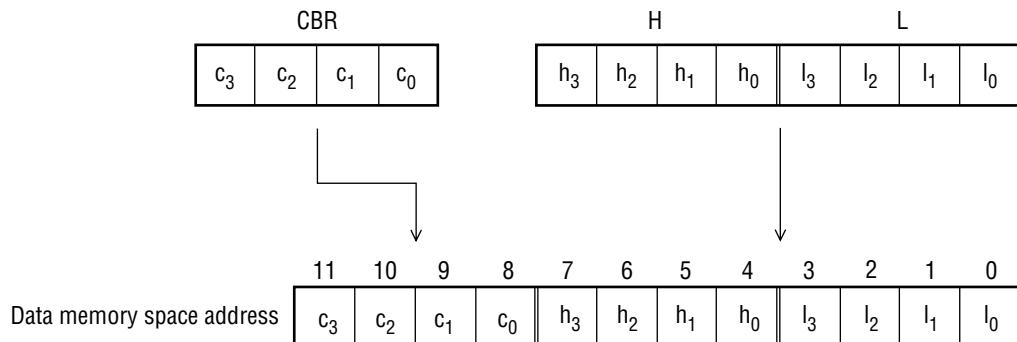

- ¥cur

#### ■ Description example

**INC ¥32H** ; Increments the content of address 32H in the bank indicated by CBR, and stores the result to address 32H and accumulator

### 2.3.2.4 HL register indirect addressing mode

The data memory space address is indirectly specified by the current bank register (CBR) and the HL register.

#### ■ Operand description

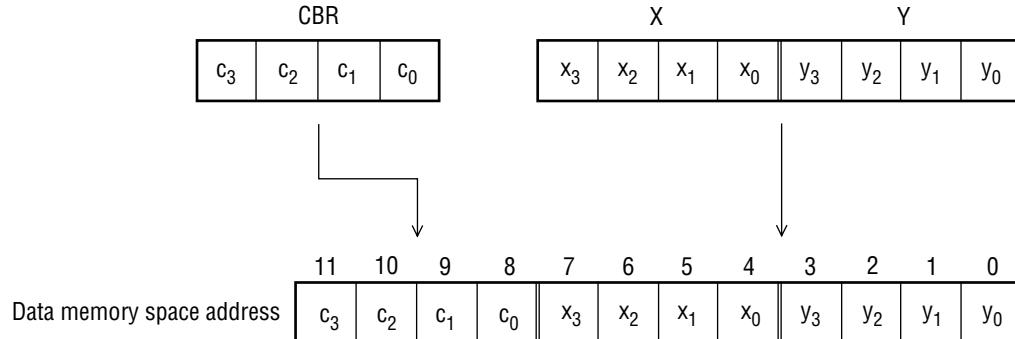

- [HL] or C:[HL]

#### ■ Description example

**MOV [HL], A** ; The accumulator content is transferred to the data memory specified by the CBR and HL registers

### 2.3.2.5 XY register indirect addressing mode

The data memory space address is indirectly specified by the current bank register (CBR) and the XY register.

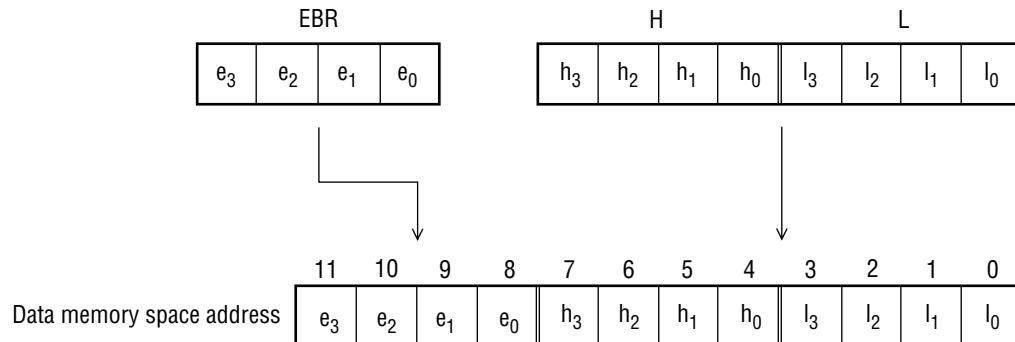

- Operand description
  - [XY] or C:[XY]

- Description example

**DEC [XY]** ; The data memory content specified by the CBR and XY registers is decremented, and the result stored to the data memory and accumulator.

### 2.3.2.6 Extra bank HL indirect addressing mode

The data memory space address is indirectly specified by the extra bank register (EBR) and the HL register.

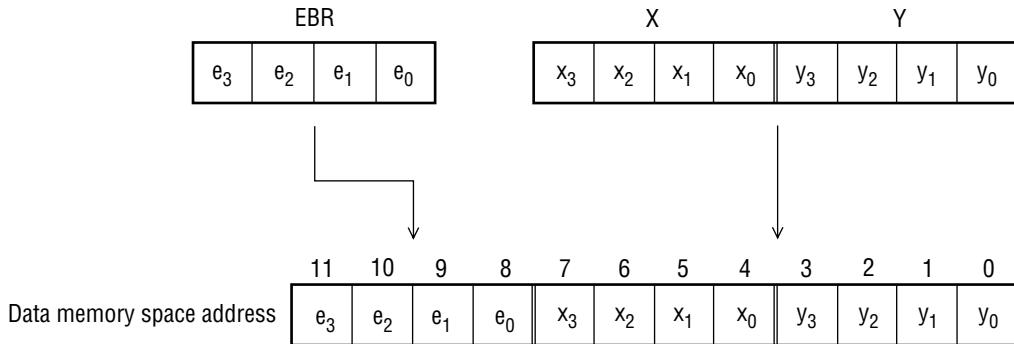

- Operand description
  - E:[HL]

- Description example

**ROR E:[HL]** ; The data memory content specified by the EBR and HL registers is rotated right, including the carry, and the result stored to the data memory and accumulator.

### 2.3.2.7 Extra bank XY indirect addressing mode

The data memory space address is indirectly specified by the extra bank register (EBR) and the XY register.

#### ■ Operand description

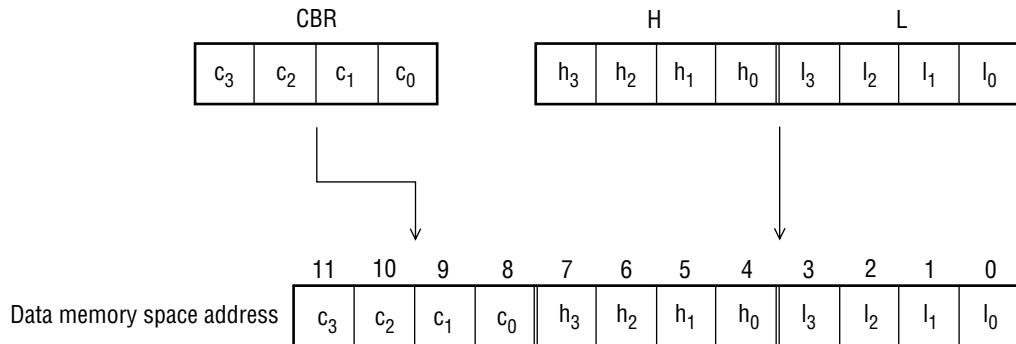

- E:[XY]

#### ■ Description example

**AND E:[XY], A** ; The logical product of the data memory content specified by the EBR and XY registers and the accumulator is stored to the data memory and accumulator.

### 2.3.2.8 HL register indirect addressing mode with post-increment

The data memory space address is indirectly specified by the current bank register (CBR) and the HL register. After execution the HL register is incremented by +1 or +2.

#### ■ Operand description

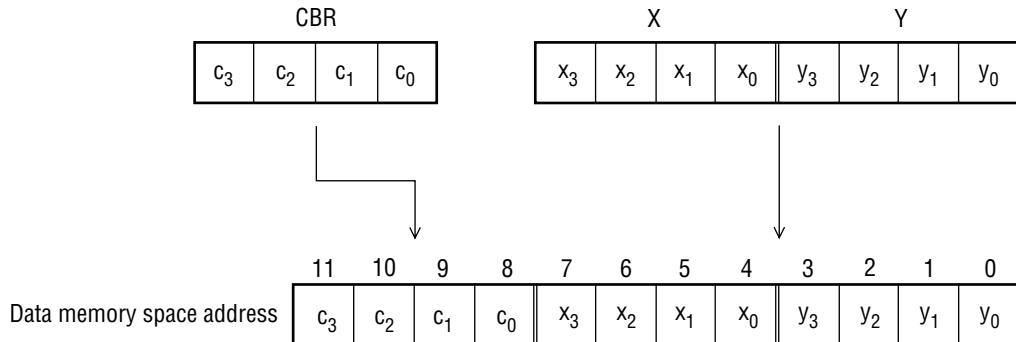

- [HL+] or C:[HL+]

#### ■ Description example

**MOV [HL+], A** ; The accumulator content is transferred to the data memory specified by the CBR and HL registers and then the HL register is incremented by one.

### 2.3.2.9 XY register indirect addressing mode with post-increment

The data memory space address is indirectly specified by the current bank register (CBR) and the XY register. After execution the XY register is incremented by +1 or +2.

#### ■ Operand description

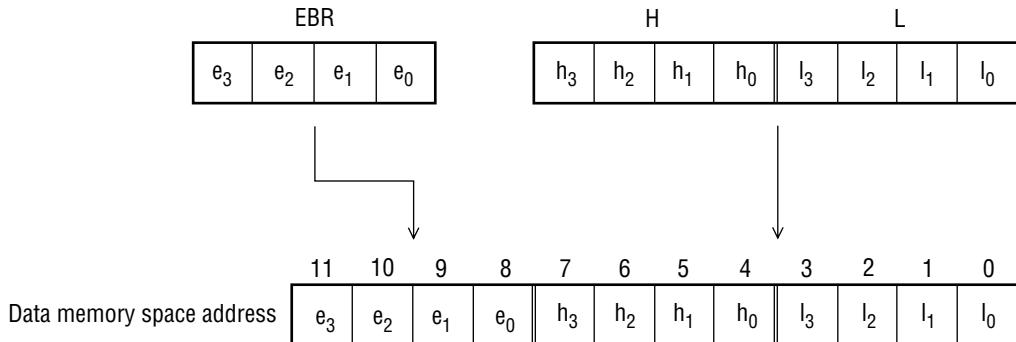

- [XY+] or C:[XY+]

#### ■ Description example

**XOR [XY+], A** ; The results of an exclusive-OR between accumulator and the data memory content specified by the CBR and XY registers are stored to the accumulator and data memory. Then the XY register is incremented by one.

### 2.3.2.10 Extra bank HL register indirect addressing mode with post-increment

The data memory space address is indirectly specified by the extra bank register (EBR) and the HL register. After execution the HL register is incremented by +1 or +2.

#### ■ Operand description

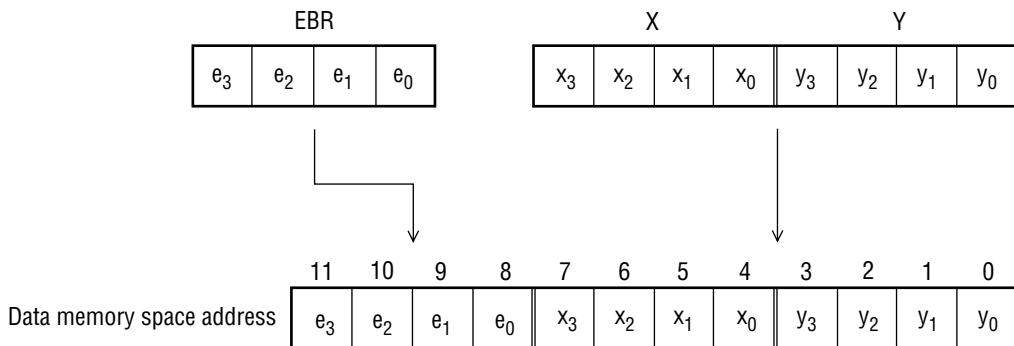

- E:[HL+]

#### ■ Description example

**MOV E:[HL+], #00H** ; Immediate data 00H is transferred to the accumulator and the data memory specified by the EBR and HL registers, then the HL register is incremented by one.

### 2.3.2.11 Extra bank XY register indirect addressing mode with post-increment

The data memory space address is indirectly specified by the extra bank register (EBR) and the XY register. After execution the XY register is incremented by +1 or +2.

#### ■ Operand description

- E:[XY+]

#### ■ Description example

**MOV E:[XY+], A** ; The accumulator content is transferred to the data memory specified by the EBR and XY registers, then the XY register is incremented by one.

### 2.3.2.12 Bit direct addressing mode

Executes data memory bit operations, which may be bit operations in 1-bit units (specified with ".n") or multi-bit operations (specified with "#m").

#### ■ Operand description

- [HL].n, [XY].n, C:[HL].n, C:[XY].n,  
 E:[HL].n, E:[XY].n, [HL+].n, [XY+].n,  
 E:[HL+].n, E:[XY+].n, ¥cur.n  
 (n = 0 ~ 3, 0:LSB, 3:MSB)

#### ■ Description example

**BCLR [XY].3** ; The third bit of the data memory specified by the CBR and XY register is cleared, and the result stored to the data memory and accumulator.

#### ■ Operand description

- #m

#### ■ Description example

**MCLR [XY].#3H** ; Bits 0 and 1 of the data memory specified by the CBR and XY register are cleared, and the result stored to the data memory and accumulator.

### 2.3.2.13 Bit indirect addressing mode

Executes data memory bit operations. The operated bit is specified by the content of the accumulator (A).

#### ■ Operand description

- A

#### ■ Description example

|             |   |
|-------------|---|
| MTST 35H, A | ; When A=3H, bits 0,1 of address 35H of the SFR (bank 0) are tested, and if either or both is zero the Z flag is set. |
|-------------|---|

### 2.3.3 Addressing modes for program memory

#### 2.3.3.1 64K word direct addressing mode

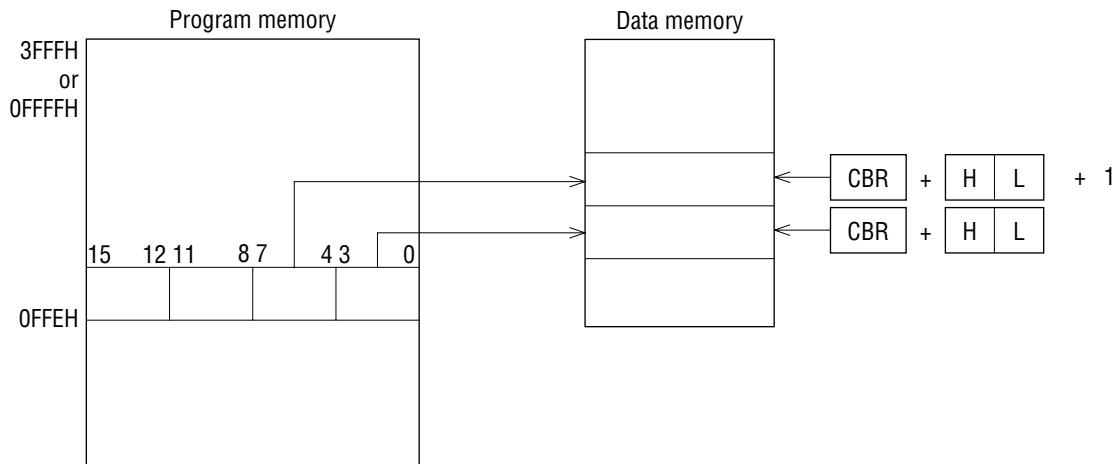

16-bit address data are used to address the entire program memory space.

##### ■ Operand description

- $\text{cadr16}$

##### ■ Description example

MOVLB [HL], 0FFEH ; The lower 8bits of program memory address 0FFEH are transferred to the data memory specified by CBR and HL registers, and to the next address in data memory.

##### ■ Description example

LJMP 0234H ; Branch to the program memory address specified by the 16-bit direct address

### 2.3.3.2 4K word page addressing mode

12-bit address data is used to address the program memory page.

#### ■ Operand description

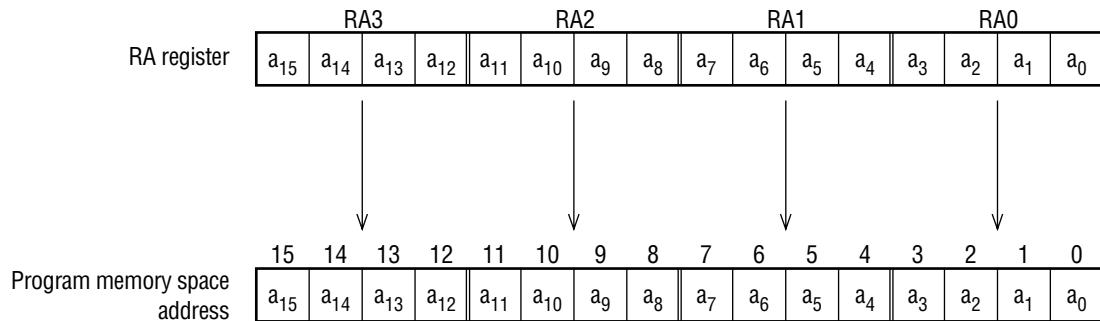

- `cadr12`

#### ■ Description example

|          |  |
|----------|--|
| JMP 123H | ; Branch to the program memory address within that page, specified by the 12-bit address |
|----------|--|

### 2.3.3.3 RA register indirect addressing mode

The program memory space address is indirectly specified with the 16-bit address data in the RA register.

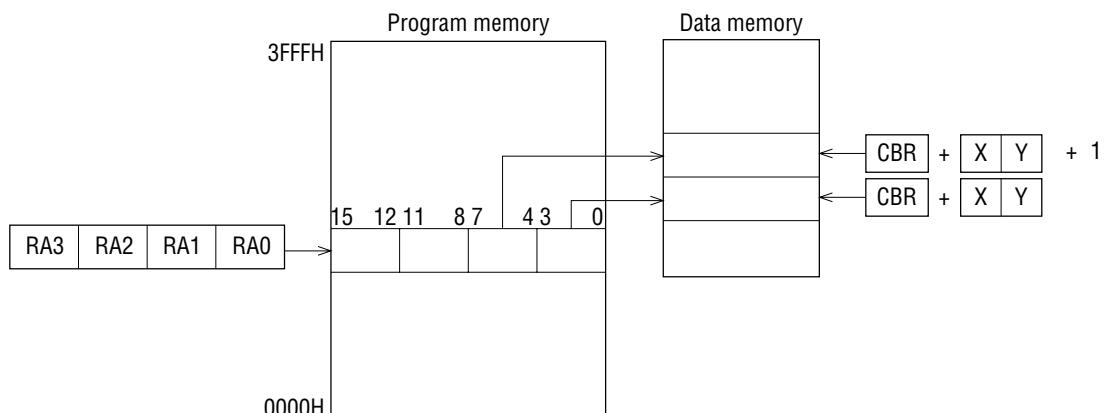

#### ■ Operand description

- `[RA]`

#### ■ Description example

|                  |   |
|------------------|---|
| MOVLB [XY], [RA] | ; The lower 8 bits of program memory address specified by RA are transferred to the data memory specified by CBR and XY registers, and to the next address in data memory |
|------------------|---|

[Note] The RA registers from 0F2F to 0F5H of SFR space and XY, HL, CBR and EBR registers from 0F9H to 0FEH should not be addressed as a transfer destination to data memory. If they are addressed, the contents of the addressed registers are undefined.

#### 2.3.3.4 PC relative addressing mode

The 8-bit address data in the instruction code is expanded to 16 bits, and the program branches to the address equal to that plus the address (PC value) for the next instruction. As a result, this type of addressing can specify a range of bytes from -128 to +127, centered on the next instruction.

- Operand description
  - raddr8
- Description example

|          |  |
|----------|--|
| SJMP 35H | ; Jumps to the address equal to the address for the next instruction plus 35H. |
|----------|--|

### 2.3.3.5 PC based addressing mode

The current address (PC value) is added to the content of the accumulator, and the program branches to that address plus one. Depending on the content of the accumulator, this gives 16 possible results.

#### ■ Operand description

- PC + A

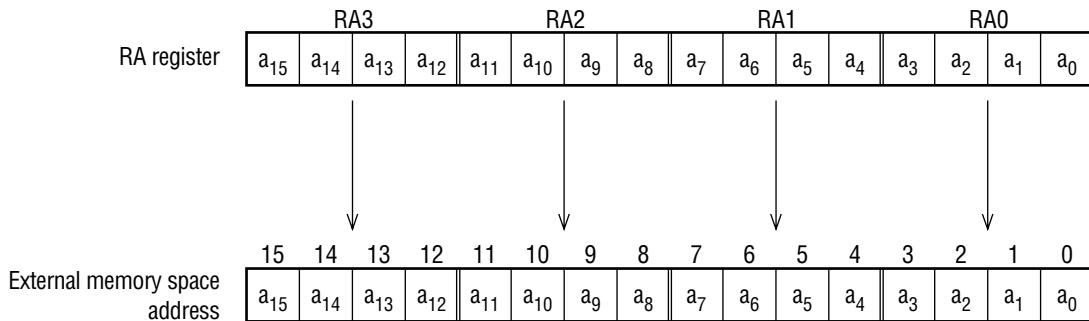

#### ■ Description example

|          |   |
|----------|---|
| JMP PC+A | ; Jumps to the address equal to the address for the next instruction (PC + 1) plus the accumulator content. |
|----------|---|

### 2.3.4 Addressing mode for external memory

#### 2.3.4.1 RA register indirect addressing mode

The external memory space address is indirectly specified by the 16-bit address data of the RA register.

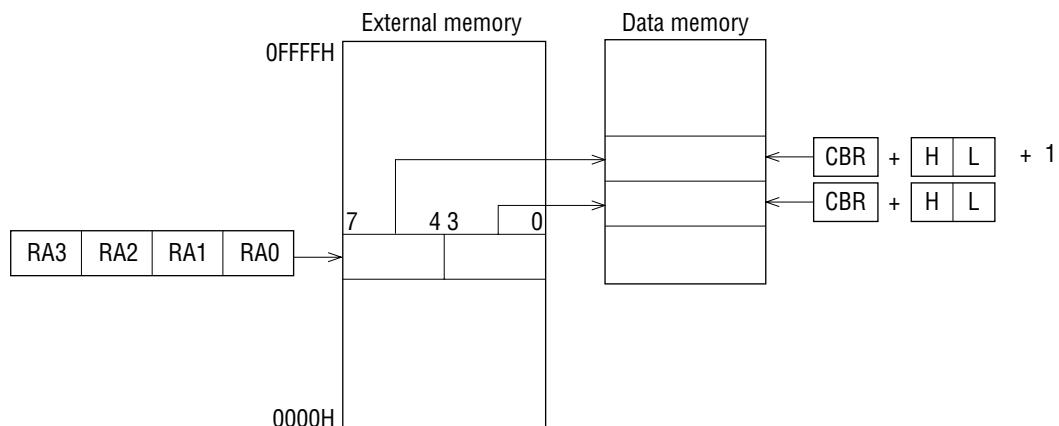

#### ■ Operand description

- [RA]

#### ■ Description example

|                  |   |
|------------------|---|
| MOVXB [HL], [RA] | ; The content of the external memory specified by RA is transferred to the data memory specified by CBR and HL registers, and to the next address in data memory. |
|------------------|---|

[Note] The RA registers from 0F2F to 0F5H of SFR space and XY, HL, CBR, EBR registers from 0F9H to 0FEH should not be addressed as a transfer destination to data memory. If they are addressed, the contents of the addressed registers are undefined.

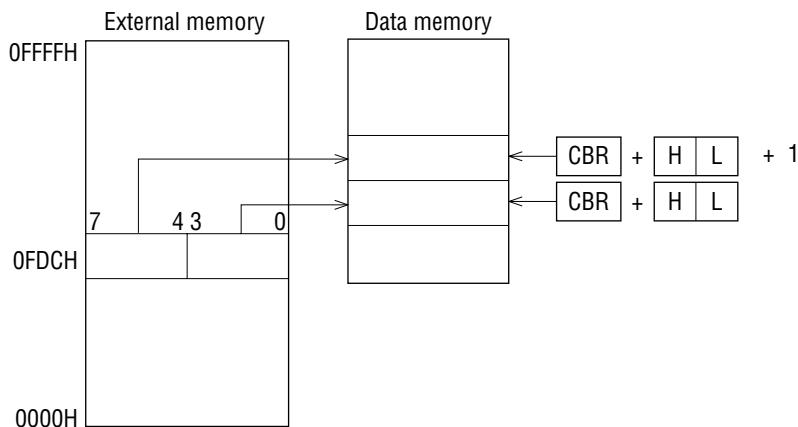

#### 2.3.4.2 Direct addressing mode

The 16-bit address data is used to address all external memory space.

- Operand description
  - xadr16
- Description example

**MOVXB [HL], 0FDCH;** The content of external memory address 0FDCH is transferred to the data memory specified by CBR and HL registers, and to the next address in data memory.

[Note] The RA registers from 0F2F to 0F5H of SFR space and XY, HL, CBR and EBR registers from 0F9H to 0FEH should not be addressed as a transfer destination to data memory. If they are addressed, the contents of the addressed registers are undefined.

## ***Chapter 2***

# **INSTRUCTION SET**

This chapter presents details on the function of the nX-4/250 core and nX-4/300 core instructions.

## 1. OVERVIEW

The nX-4/250 core and nX-4/300 core instruction codes are 16-bit length, and most instructions operate at one word per cycle.

The nX-4/250 core and nX-300 core have 440 kinds of instruction, and 450 kinds of instruction respectively.

|   | nX-4/250 | nX-4/300 |
|---|----------|----------|
| • Transfer instructions .....                 | 38 types | 38 types |
| • Rotate instructions .....                   | 20 types | 20 types |
| • Increment/decrement instructions .....      | 20 types | 20 types |
| • Arithmetic operation instructions .....     | 96 types | 96 types |
| • Comparison instructions .....               | 19 types | 19 types |
| • Logical operation instructions .....        | 57 types | 57 types |
| • Mask operation instructions .....           | 46 types | 50 types |
| • Bit operation instructions .....            | 36 types | 40 types |
| • ROM table reference instructions .....      | 32 types | 32 types |
| • External memory transfer instructions ..... | 32 types | 32 types |
| • Stack operation instructions .....          | 4 types  | 4 types  |
| • Flag operation instructions .....           | 6 types  | 8 types  |
| • Branch instructions .....                   | 4 types  | 4 types  |
| • Conditional branch instructions .....       | 7 types  | 7 types  |
| • Call/return instructions .....              | 5 types  | 5 types  |
| • Control instructions .....                  | 18 types | 18 types |

These instructions can be classified by word length and machine cycle as shown below.

|                                  |           |           |
|----------------------------------|-----------|-----------|
| • 1 word/1 machine cycle .....   | 369 types | 379 types |
| • 1 word/2 machine cycles .....  | 28 types  | 28 types  |
| • 1 word/3 machine cycles .....  | 8 types   | 8 types   |
| • 2 words/2 machine cycles ..... | 2 types   | 2 types   |
| • 2 words/3 machine cycles ..... | 33 types  | 33 types  |

Instructions have the following functions:

- (1) Transfer instructions  
These instructions handle data memory transfer and immediate data transfer between accumulator and data memory.
- (2) Rotate instructions  
These instructions rotate data memory left and right.
- (3) Increment/decrement instructions  
These instructions handle data memory increment and decrement.
- (4) Arithmetic operation instructions  
These instructions handle add and subtract operations for data memory and accumulator, or data memory and immediate data.
- (5) Comparison instructions  
These instructions handle comparison between data memory and accumulator, or data memory and immediate data.
- (6) Logical operation instructions  
These instructions handle logical product, logical add and exclusive OR between data

# nX-4/250/300 Core Instruction Manual

## Chapter 2 Instruction set

---

- (7) memory and accumulator, or data memory and immediate data.  
Mask operation instructions  
These instructions handle set, clear and transfer operations for non-masked data memory bits.
- (8) Bit operation instructions  
These instructions handle set, clear and transfer operations for special data memory bits.
- (9) ROM table reference instructions  
These instructions handle transfer of program memory table data to data memory.
- (10) External memory transfer instructions  
These instructions handle transfer of external memory data to data memory.
- (11) Stack operation instructions  
These instructions handle save of flag register, accumulator, HL registers, XY register, extra bank register and current bank register to the register stack, and restore operations.
- (12) Flag operation instructions  
These instructions handle set and clear operations for the zero flag, carry flag and G flag.
- (13) Branch instructions  
These instructions execute branches to program memory absolute and relative addresses.
- (14) Conditional branch instructions  
These instructions execute branches as per the contents of the zero flag, carry flag and G flag.
- (15) Call/return instructions  
These instructions execute subroutine call/return processing, and return from interrupt routines.
- (16) Control instructions  
These instructions set the current bank register, extra bank register, RA0 to RA3 registers, HL register, and XY register, as well as starting melody and halting the CPU.

## **2. OPERAND EXPRESSION**

There are two types of instructions: those which have one or two operands, and those which have none.

Operands are specified in the order of <destination>, <source>. Note that for the MTST, MCLR, MSET and MNOT instructions, the mask value is given for the second operand.

### ■ Explanation of symbols

The following symbols are used in this chapter.

#### **[Register names]**

- A ..... Accumulator
- Z ..... Zero flag
- C ..... Carry flag
- G ..... G flag
- FLAG ..... Flag register (cumulative name for Z, C and G flags)
- CBR ..... Current bank register
- EBR ..... Extra bank register
- H ..... H register
- L ..... L register
- HL ..... HL register
- X ..... X register
- Y ..... Y register
- XY ..... XY register
- RA0 ..... RA0 register
- RA1 ..... RA1 register
- RA2 ..... RA2 register
- RA3 ..... RA3 register
- RA ..... RA register (cumulative name for RAO to RA3 registers)
- SP ..... Stack pointer (for call stack)
- RSP ..... Register stack pointer (for register stack)
- MIE ..... Master interrupt enable flag

**[Addressing names]**

- direct ..... Direct addressing
- sfr ..... SFR bank (bank 0) internal direct addressing
- cur ..... Current bank internal direct addressing
- bank:[reg] ..... Cumulative name for register indirect addressing
- [HL] ..... HL register indirect addressing
- [XY] ..... XY register indirect addressing
- C:[HL] ..... HL register indirect addressing
- C:[XY] ..... XY register indirect addressing
- E:[HL] ..... Extra bank HL register indirect addressing
- E:[XY] ..... Extra bank XY register indirect addressing
- bank:[reg+] ..... Cumulative name for post-incremented register indirect addressing
- [HL+] ..... Post-incremented HL register indirect addressing
- [XY+] ..... Post-incremented XY register indirect addressing
- C:[HL+] ..... Post-incremented HL register indirect addressing
- C:[XY+] ..... Post-incremented XY register indirect addressing
- E:[HL+] ..... Post-incremented extra bank HL register indirect addressing
- E:[XY+] ..... Post-incremented extra bank XY register indirect addressing
- [RA] ..... RA register indirect addressing
- cadr16 ..... 64K word internal direct addressing
- cadr12 ..... 4K word page internal addressing
- raddr8 ..... PC relative addressing
- PC+A ..... PC based addressing

**[Other]**

- ← ..... Indicates data replacement direction
- ↔ ..... Data swap
- + ..... Add
- - ..... Subtract
- = ..... Equal
- ≠ ..... Not equal
- ^ ..... Logical product
- ∨ ..... Logical add
- ∇ ..... Exclusive logical add
- — ..... Inverse (complement of 1)

### 3. LIST OF INSTRUCTIONS

The format used in the list of instructions is indicated below.

| MNEMONIC | OPERATION | W | C | INSTRUCTION CODE |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | FLAG |   |   | PAGE |
|----------|-----------|---|---|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|------|---|---|------|
|          |           |   |   | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Z    | C | G |      |
|          |           |   |   |                  |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |      |   |   |      |

Indicates the short-form name for the instruction.

Indicates the instruction function.

Indicates the instruction word length.

Indicates the number of machine cycles needed to execute the instruction.

Indicates the instruction code content. For a 2-word long instruction, the first part shows the first word, and the second part the second word.

Flags marked with a circle are affected by instruction execution, and those that are not affected with a dash.

Refer to this page for additional information.

[Note] Only the nX-4/300 core has MMOV, BMOV, FCLR FLAG and FSET FLAG instructions.

● Transfer Instructions

| MNEMONIC        | OPERATION           | W | C | INSTRUCTION CODE |    |    |    |                 |                 |                |                |                |                |                |                |                |                |                | FLAG           |                |   | PAGE |    |
|-----------------|---------------------|---|---|------------------|----|----|----|-----------------|-----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|---|------|----|
|                 |                     |   |   | 15               | 14 | 13 | 12 | 11              | 10              | 9              | 8              | 7              | 6              | 5              | 4              | 3              | 2              | 1              | 0              | Z              | C | G    |    |

#### 4. INSTRUCTION DESCRIPTIONS

Instructions are detailed below. Refer to the following guides for information.

| <Item name>   |                     |
|---|---------------------|
| <b>obj</b>  | <b>obj</b>          |
| Indicates items that can be described in the instruction operand      |                     |
| <b>Function</b>   | <b>Function</b>     |
| Indicates the function using symbols                                  |                     |
| <b>Description</b>  | <b>Description</b>  |
| Describes the instruction and gives precautions in use                |                     |
| <b>Flags</b>  | <b>Flags</b>        |
| Indicates flags affected by execution of the instruction              |                     |
| <b>Codes/Cycles</b>   | <b>Codes/Cycles</b> |
| Indicates the instruction operand, instruction code and machine cycle |                     |

## ADC obj, A

(add data memory and accumulator with carry)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj + A + C  
 (for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The data memory specified by obj is added to the accumulator and the carry flag, and the results stored to data memory and the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction  
 Flag change conditions

if obj + A + C = 0  
 then Z  $\leftarrow$  1  
 else Z  $\leftarrow$  0  
 if obj + A + C > 0FH  
 then C  $\leftarrow$  1  
 else C  $\leftarrow$  0  
 (for post-increment)  
 if  $HL + 1 = 0$  or  $XY + 1 = 0$   
 then G  $\leftarrow$  1  
 else G  $\leftarrow$  0

| Z                     | C                     | G                     |

## ADCD obj, A

(add data memory and accumulator decimal adjustment, with carry)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  decimal adjust {obj + A + C}

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

The data memory specified by obj is added to the accumulator and the carry flag, and the results stored to data memory and the accumulator if 9 or less. If the results are greater than 9, the decimal adjustment 6H is added and the results stored to data memory and the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if decimal adjustment = 0

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

if overflow results from operation

C  $\leftarrow$  1 else C  $\leftarrow$  0

(for post-increment)

if HL + 1 = 0 or XY + 1 = 0

then G  $\leftarrow$  1

else G  $\leftarrow$  0

| Z                     | C                     | G                     |

## ADCJ obj, n

(data memory base-n adjustment addition, with carry)

### obj

For no post-increment:  $\$cur, [HL], [XY], E:[HL], E:[XY]$

For post-increment:  $[HL+], [XY+], E:[HL+], E:[XY+]$

### Function

$obj, A \leftarrow n \text{ adjust } \{obj + C\}$  ( $n$  is even number from 2 to 16)  
(for post-increment)

$HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The data memory specified by obj is added to the carry flag, the base-n results adjusted, and the results stored to data memory and the accumulator. If the results of base-n adjustment are greater than  $n$ , the adjustment (two's complement of  $n$ ) is added.  $n$  is an even number from 2 to 16. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if base-n adjustment = 0

then  $Z \leftarrow 1$

else  $Z \leftarrow 0$

if overflow results from adjustment, or if  $n = 16$

$C \leftarrow 1$  else  $C \leftarrow 0$

(for post-increment)

if  $HL + 1 = 0$  or  $XY + 1 = 0$

then  $G \leftarrow 1$

else  $G \leftarrow 0$

| Z                     | C                     | G                     |

| Values of $n_2$ to $n_0$ in instruction code | 1H | 2H | 3H | 4H | 5H | 6H | 7H | 0H |

## ADD obj, A

(add data memory and accumulator)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj + A  
(for post-increment)  
HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

The data memory specified by obj is added to the accumulator, and the results stored to data memory and the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction  
Flag change conditions

```

if obj + A = 0
  then Z  $\leftarrow$  1
  else Z  $\leftarrow$  0
if obj + A > 0FH
  then C  $\leftarrow$  1
  else C  $\leftarrow$  0
(for post-increment)
if HL + 1 = 0 or XY + 1 = 0
  then G  $\leftarrow$  1
  else G  $\leftarrow$  0

```

## ADD obj, #i4

(add data memory and immediate data)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj}, A \leftarrow \text{obj} + i4$   
 (for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The data memory specified by obj is added to immediate data i4, and the results stored to data memory and the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction  
 Flag change conditions

if  $\text{obj} + i4 = 0$   
 then Z  $\leftarrow 1$   
 else Z  $\leftarrow 0$   
 if  $\text{obj} + i4 > 0FH$   
 then C  $\leftarrow 1$   
 else C  $\leftarrow 0$   
 (for post-increment)  
 if  $HL + 1 = 0$  or  $XY + 1 = 0$   
 then G  $\leftarrow 1$   
 else G  $\leftarrow 0$

## AND obj, A

(logical product of data memory and accumulator)

### obj

For no post-increment: sfr, \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj  $\wedge$  A  
(for post-increment)  
HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

The logical product of the data memory specified by obj and the accumulator is taken, and the results stored to data memory and the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

### Description

If the condition is true, the content of raddr8 is added to Next PC and program execution branches. If the condition is false the content of PC is incremented by one, and the next instruction is executed.

The branch destination address is a range of -128 to +127 from the Next PC address. The 8 bits in the instruction code (a<sub>7</sub> to a<sub>0</sub>) correspond to raddr8, with the 8th bit (a<sub>7</sub>) used as a sign. It indicates the relative displacement from the address immediately after the instruction.

Branches across program memory space page boundaries are possible.  
In Assembler it is possible to directly specify an address within the branch range (label) instead of raddr8.

## BCLR obj. n

(data memory bit clear)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj. n  $\leftarrow$  0, A  $\leftarrow$  obj (n = 0 ~ 3)

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

n bits of the data memory specified by obj are cleared. After the clear operation, the content of obj is stored to the accumulator. The value of n is 0 to 3, indicating the positions of the bits to be cleared. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if obj. n  $\leftarrow$  0 then obj = 0

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

(for post-increment)

if HL + 1 = 0 or XY + 1 = 0

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## BMOV obj. n, A. n

(transfer bit to data memory)

### obj

[HL], [XY], E:[HL], E:[XY]

### Function

$\text{obj}.n \leftarrow A.n, A \leftarrow \text{obj}$  ( $n = 0 \sim 3$ )

### Description

$n$  bits of the accumulator are transferred to bit  $n$  of the data memory specified by obj.  
After the operation, the content of data memory is stored to the accumulator. The value of  $n$  is 0 to 3, indicating the positions of the bits to be cleared.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if  $\text{obj}.n \leftarrow A.n$  then  $\text{obj} = 0$   
then  $Z \leftarrow 1$   
else  $Z \leftarrow 0$

| $n_3-n_0$ values in instruction code | 1H | 2H | 4H | 8H |

[Note] Only the nX-4/300 core has BMOV instruction.

## BNOT obj. n

(data memory bit reversal)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj. n  $\leftarrow$  obj. n, A  $\leftarrow$  obj (n = 0 ~ 3)

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

n bits of the data memory specified by obj are reversed. After the operation, the content of obj is stored to the accumulator. The value of n is 0 to 3, indicating the positions of the bits to be reversed. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if obj. n  $\leftarrow$  obj. n then obj = 0

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

(for post-increment)

if HL + 1 = 0 or XY + 1 = 0

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## BSET obj. n

(data memory bit set)

### obj

For no post-increment:  $\$cur, [HL], [XY], E:[HL], E:[XY]$

For post-increment:  $[HL+], [XY+], E:[HL+], E:[XY+]$

### Function

$obj. n \leftarrow 1, A \leftarrow obj (n = 0 \sim 3)$

(for post-increment)

$HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

n bits of the data memory specified by obj are set. After the operation, the content of obj is stored to the accumulator. The value of n is 0 to 3, indicating the positions of the bits to be set. For post-incremented operations, the HL or XY register is then incremented.

### Flags

## BTST obj. n

(data memory bit test)

### obj

For no post-increment:  $\$cur, [HL], [XY], E:[HL], E:[XY]$

For post-increment:  $[HL+], [XY+], E:[HL+], E:[XY+]$

### Function

$Z \leftarrow \underline{\text{obj. } n}$ , ( $n = 0 \sim 3$ )

(for post-increment)

$HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

$n$  bits of the data memory specified by obj are tested, and if one then  $Z \leftarrow 0$ , and if 0 then  $Z \leftarrow 1$ . The value of  $n$  is 0 to 3, indicating the positions of the bits to be tested.

For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

## CAL adr12

(subroutine call)

### obj

$(SP) \leftarrow PC, PC_{11\sim 0} \leftarrow adr12, SP \leftarrow SP + 1$

### Description

The contents of the program counter (PC) are saved to the call stack, and the subroutine called. The call stack pointer is then incremented. The subroutine address is a 12-bit immediate value specifying an absolute address in the program memory space page (4K word). In other words, the content does not change between the 15-bit PC value and the 12-bit specification. adr12 specifies the called address.

## CMP obj, A

(comparison of data memory and accumulator)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj - A

if obj = A then Z ← 1, C ← 0

if obj > A then Z ← 0, C ← 0

if obj < A then Z ← 0, C ← 1

(for post-increment)

HL ← HL + 1 or XY ← XY + 1

### Description

The content of the data memory specified by obj are compared to the contents of the accumulator, and the results reflected in a flag. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Refer to function column

## DEC obj

(decrement)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj - 1  
 (for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The content of the data memory specified by obj is decremented and the results stored to the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if obj - 1 = 0FH  
 then C  $\leftarrow$  1  
 else C  $\leftarrow$  0  
 if obj - 1 = 0  
 then Z  $\leftarrow$  1  
 else Z  $\leftarrow$  0  
 (for post-increment)  
 if HL + 1 = 0 or XY + 1  
 then G  $\leftarrow$  1  
 else G  $\leftarrow$  0

| Z                     | C                     | G                     |
|-----------------------|-----------------------|-----------------------|
| <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

## DI

(MIE flag clear)

### Function

MIE  $\leftarrow$  0

### Description

Clears the master interrupt enable flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | — | — |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Machine Cycle |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---------------|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |               |
| DI      | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1             |

---

## EI

(MIE flag set)

### Function

MIE  $\leftarrow$  1

### Description

Sets the master interrupt enable flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | — | — |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Machine Cycle |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---------------|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |               |
| EI      | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 1             |

## FCLR C

(carry flag clear)

### Function

$C \leftarrow 0$

### Description

Clears the carry flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | ○ | — |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Machine Cycle |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---------------|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |               |
| C       | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1             |

## FCLR FLAG

(zero flag, csrry flag and G flag clear)

### Function

$Z \leftarrow 0, C \leftarrow 0, G \leftarrow 0$

### Description

Clears the zero flag, carry flag and G flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| ○ | ○ | ○ |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Machine Cycle |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---------------|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |               |
| FLAG    | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1             |

[Note] Only the nX-4/300 core has FCLR FLAG instruction.

## FCLR G

(G flag clear)

### Function

$G \leftarrow 0$

### Description

Clears the G flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | — | O |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   | Machine Cycle |   |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------------|---|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0             |   |
| G       | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0             | 1 |

## FCLR Z

(zero flag clear)

### Function

$Z \leftarrow 0$

### Description

Clears the zero flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| O | — | — |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   | Machine Cycle |   |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------------|---|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0             |   |
| Z       | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0             | 1 |

## FSET C

(set carry flag)

### Function

$C \leftarrow 1$

### Description

Sets the carry flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | ○ | — |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Machine Cycle |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---------------|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |               |
| C       | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1             |

## FSET FLAG

(zero flag, carry flag and G flag set)

### Function

$Z \leftarrow 1, C \leftarrow 1, G \leftarrow 1$

### Description

Sets the zero flag, carry flag and G flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| ○ | ○ | ○ |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Machine Cycle |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---------------|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |               |
| FLAG    | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1             |

[Note] Only the nX-4/300 core has FSET FLAG instruction.

## FSET G

(set G flag)

### Function

$G \leftarrow 1$

### Description

Sets the G flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | — | ○ |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   | Machine Cycle |   |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------------|---|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0             |   |
| G       | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0             | 1 |

## FSET Z

(set zero flag)

### Function

$Z \leftarrow 1$

### Description

Sets the zero flag.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| ○ | — | — |

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   | Machine Cycle |   |
|---------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------------|---|
|         | 15               | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0             |   |
| Z       | 0                | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0             | 1 |

## **HALT**

(CPU halt mode)

### **Function**

Halt CPU

### **Description**

Switches the CPU to the halt mode.

[Precautions]

Always use an NOP instruction immediately after the HALT instruction.

Example

•  
•  
•  
HALT  
NOP  
•  
•

## INC obj

(increment)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj + 1  
(for post-increment)  
HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

The content of the data memory specified by obj is incremented, and the results stored to the accumulator. For post-incremented operations, the HL or XY register is then incremented.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if obj + 1 = 0  
then C  $\leftarrow$  1, Z  $\leftarrow$  1  
else C  $\leftarrow$  0, Z  $\leftarrow$  0  
(for post-increment)  
if HL + 1 = 0 or XY + 1 = 0  
then G  $\leftarrow$  1  
else G  $\leftarrow$  0

## INCB obj

(HL, XY pair register increment)

**obj**

HL, XY

### Function

$\text{obj} \leftarrow \text{obj} + 1$  (byte increment)

### Description

Increments the HL or XY registers in byte units.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if  $\text{HL} + 1 = 0$  or  $\text{XY} + 1 = 0$

then  $\text{G} \leftarrow 1$

else  $\text{G} \leftarrow 0$

## JMP cadr12

(branch)

### Function

$PC_{11\sim 0} \leftarrow cadr12$

### Description

12-bit immediate data is used to specify the program memory space page region (4K word), and branch to an absolute address. There is no change in data from 15-bit PC to 12-bit.

cadr12 specifies the called address.

## JMP PC+A

(branch as per content of accumulator)

### Function

$PC \leftarrow PC + A + 1$

### Description

The content of the accumulator is added to the program counter (PC), one added, and the result stored to the PC.

Branches are possible across program memory space page boundaries.

### Flags

Flags affected by execution of this instruction

| Z | C | G |

## LCAL adr16

(call subroutine)

### Function

$(SP) \leftarrow PC, PC \leftarrow adr16, SP \leftarrow SP + 1$

### Description

The contents of the second word of the program counter (PC) are saved to the call stack, and the subroutine called. The call stack pointer is then incremented. The subroutine address is a 16-bit immediate value specifying an absolute address in the program memory space (64K word).  
 adr16 specifies the called address.

## MCLR obj, #m

(data memory bit clear)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

Bits not masked by obj #m  $\leftarrow 0$ , A  $\leftarrow$  obj ( $m = 0 \sim 0FH$ )  
(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

Clears all bits not masked by immediate data m, in the data memory specified by obj.

After the clear operation the content of obj is stored to the accumulator. m is a value in the range 0 to 0FH, with a "1" masking a bit and a "0" marking a bit to be cleared.

For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if obj = 0

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

(for post-increment)

if HL + 1 = 0 or XY + 1 = 0

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## MMOV obj, #m, A.n

(bit transfer to data memory)

**obj**

[HL], [XY], E:[HL], E:[XY]

**Function**

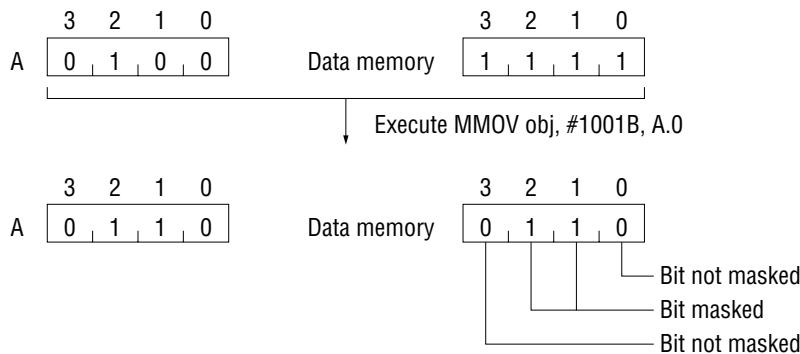

Bits not masked by obj #m  $\leftarrow$  A. n, A  $\leftarrow$  obj (m = 0 ~ 0FH, n = 0 ~ 3)

**Description**

Transfers bits specified by n from accumulator to bits of the data memory specified by obj which are not masked by m. After the transfer, the data memory is stored to the accumulator.

m is a value from 0 to 0FH, which a "0" masking a bit and a "1" masking a bit for transfer. n is a value 0 to 3, and marks the accumulator bit position.

**Example**

**Flags**

[Note] Only the nX-4/300 core has MMOV instruction.

## MNOT obj, #m

(data memory bit reversal)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

Reverses bits not masked by obj #m

$A \leftarrow \text{obj} \ (m = 0 \sim 0F)$

(for post-increment)

$HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

Reverses all bits not masked by m in the data memory specified by obj. After the clear operation the content of obj is stored to the accumulator. m is a value in the range 0 to OFH, with a "0" masking a bit and a "1" marking a bit to be reversed. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if  $\text{obj} = 0$

then  $Z \leftarrow 1$

else  $Z \leftarrow 0$

(for post-increment)

if  $HL + 1 = 0$  or  $XY + 1 = 0$

then  $G \leftarrow 1$

else  $G \leftarrow 0$

## MOV obj, #i4

(transfer immediate data to accumulator and data memory)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  i4

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

Transfers immediate data i4 to accumulator and data memory specified by obj. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if A = 0

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

(for post-increment)

if HL + 1 = 0 or XY + 1 = 0

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## MOVHB obj, [RA]

(ROM table reference)

### obj

For no post-increment: [HL], [XY], E:[HL], E:[XY]  
For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

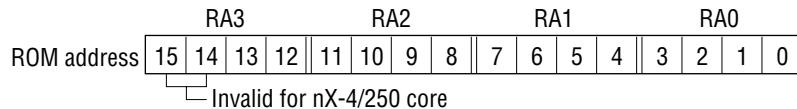

### Function

$\text{obj} \leftarrow (\text{RA})_{11\sim8}$   
 $\text{obj} + 1 \leftarrow (\text{RA})_{15\sim12}$   
 (for post-increment)  
 $\text{HL} \leftarrow \text{HL} + 2$  or  $\text{XY} \leftarrow \text{XY} + 2$

### Description

This instruction refers to the ROM table.

RA3 through RA0 compose the address as indicated below. The high 8-bit data at that address in program memory is transferred to the data memory specified by obj.

Bits 11 through 8 of program memory are transferred to the data memory specified by obj, and bits 15 to 12 to the data memory specified as obj+1. For post-increment operations, the HL or XY register is incremented by 2 after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions  
 (for post-increment)

if  $\text{HL} + 2 > 0FFH$  or  $\text{XY} + 2 > 0FFH$   
 then  $\text{G} \leftarrow 1$   
 else  $\text{G} \leftarrow 0$

## MOVHB obj, cadr16

(ROM table reference)

### obj

For no post-increment: [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj} \leftarrow (\text{cadr16})_{11\sim8}$

$\text{obj} + 1 \leftarrow (\text{cadr16})_{15\sim12}$

(for post-increment)

$\text{HL} \leftarrow \text{HL} + 2$  or  $\text{XY} \leftarrow \text{XY} + 2$

### Description

This instruction refers to the ROM table.

The high 8-bit data in program memory specified by cadr16 is byte-transferred to the data memory specified by obj.

Bits 11 through 8 of program memory are transferred to the data memory specified by obj, and bits 15 to 12 to the data memory specified as obj+1. For post-increment operations, the HL or XY register is incremented by 2 after execution.

### Flags

## MOVLB obj, [RA]

(ROM table reference)

### obj

For no post-increment: [HL], [XY], E:[HL], E:[XY]  
For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

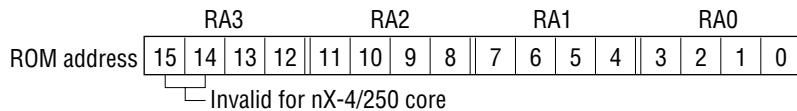

### Function

$\text{obj} \leftarrow (\text{RA})_{3\sim 0}$   
 $\text{obj} + 1 \leftarrow (\text{RA})_{7\sim 4}$   
 (for post-increment)  
 $\text{HL} \leftarrow \text{HL} + 2$  or  $\text{XY} \leftarrow \text{XY} + 2$

### Description

This instruction refers to the ROM table.

RA3 through RA0 compose the address as indicated below. The low 8-bit data at that address in program memory is transferred to the data memory specified by obj.

Bits 3 through 0 of program memory are transferred to the data memory specified by obj, and bits 7 to 4 to the data memory specified as obj+1. For post-increment operations, the HL or XY register is incremented by 2 after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions  
(for post-increment)

if  $\text{HL} + 2 > 0FFH$  or  $\text{XY} + 2 > 0FFH$

## MOVLB obj, cadr16

(ROM table reference)

### obj

For no post-increment: [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj} \leftarrow (\text{cadr16})_{3\sim 0}$

$\text{obj} + 1 \leftarrow (\text{cadr16})_{7\sim 4}$

(for post-increment)

$\text{HL} \leftarrow \text{HL} + 2$  or  $\text{XY} \leftarrow \text{XY} + 2$

### Description

This instruction refers to the ROM table.

The low 8-bit data in program memory specified by cadr16 is byte-transferred to the data memory specified by obj.

Bits 3 through 0 of program memory are transferred to the data memory specified by obj, and bits 7 to 4 to the data memory specified as obj+1. For post-increment operations, the HL or XY register is incremented by 2 after execution.

## MOVXB obj, [RA]

(transfer external memory to data memory)

### obj

For no post-increment: [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj} \leftarrow (\text{RA})_{3\sim 0}$

$\text{obj} + 1 \leftarrow (\text{RA})_{7\sim 4}$

(for post-increment)

$\text{HL} \leftarrow \text{HL} + 2$  or  $\text{XY} \leftarrow \text{XY} + 2$

### Description

This instruction transfers external memory.

The address is specified by RA3 to RA0 as indicated below. 8-bit data in external memory specified is byte-transferred to the data memory specified by obj.

| External memory address | RA3   | RA2 | RA1 | RA0 |
|-------------------------|---|-----|-----|-----|
|                         | 15   14   13   12   11   10   9   8   7   6   5   4   3   2   1   0 |     |     |     |

Bits 3 through 0 of external memory are transferred to the data memory specified by obj, and bits 7 to 4 to the data memory specified as obj+1. For post-increment operations, the HL or XY register is incremented by 2 after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

(for post-increment)

if  $\text{HL} + 2 > 0\text{FFH}$  or  $\text{XY} + 2 > 0\text{FFH}$

then G  $\leftarrow 1$

else G  $\leftarrow 0$

For no post-increment: [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

(RA) 3~0  $\leftarrow$  obj

(RA) 7~4  $\leftarrow$  obj

(for post-increment)

HL  $\leftarrow$  HL + 2 or XY  $\leftarrow$  XY + 2

### Description

This instruction transfers external memory.

The address is specified by RA3 to RA0 as indicated below. Data in the data memory specified by obj is byte-transferred to the specified external memory.

|                         | RA3 | RA2 | RA1 | RA0                                   |
|-------------------------|-----|-----|-----|---------------------------------------|
| External memory address | 15  | 14  | 13  | 12    11 10 9 8    7 6 5 4    3 2 1 0 |

Data memory specified by obj is transferred to bits 3 through 0 of external memory, and data memory specified by obj+1 is transferred to external memory bits 7 to 4.

For post-increment operations, the HL or XY register is incremented by 2 after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

(for post-increment)

if HL + 2 > OFFH or XY + 2 > OFFH

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## MOVXB xadr16, obj

(transfer data memory to external memory)

### obj

For no post-increment: [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

(cadr16)  $_{3 \sim 0} \leftarrow \text{obj}$

(cadr16)  $_{7 \sim 4} \leftarrow \text{obj}$

(for post-increment)

$\text{HL} \leftarrow \text{HL} + 2$  or  $\text{XY} \leftarrow \text{XY} + 2$

### Description

This instruction transfers external memory.

Data in the data memory specified by obj is byte-transferred to external memory specified by xadr16.

Data memory specified by obj is transferred to bits 3 through 0 of external memory, and data memory specified by obj+1 is transferred to external memory bits 7 to 4.

For post-increment operations, the HL or XY register is incremented by 2 after execution.

### Flags

## MSET obj, #m

(data memory bit set)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

Bits not masked by obj  $\leftarrow 1$ , A  $\leftarrow$  obj ( $m = 0 \sim 0F$ )  
(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

Sets all bits not masked by immediate data m, in the data memory specified by obj.  
After the clear operation the content of obj is stored to the accumulator. m is a value in the range 0 to 0FH, with a "0" masking a bit and a "1" marking a bit to be set. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions  
(for post-increment)

if HL + 1 = 0 or XY + 1 = 0  
then G  $\leftarrow$  1  
else G  $\leftarrow$  0

| Z                     | C | G                     |

## MTST obj, A

(data memory bit test)

### obj

For no post-increment: sfr, \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

If any of the bits not masked by A is "0",

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

Tests all bits not masked by accumulator in the data memory specified by obj. If even one bit is "0", sets the Z flag. In the accumulator a "0" masks a bit and a "1" marks a bit to be tested. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

See function column

(for post-increment)

if HL + 1 = 0 or XY + 1 = 0

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## MTST obj, #m

(data memory bit test)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

If any of the bits not masked by m is "0",

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

Tests all bits not masked by immediate data m in the data memory specified by obj.

If even one bit is "0", sets the Z flag. m is a value from 0 to 0FH, with a "0" masking a bit and a "1" marking a bit to be tested. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

See function column

## OR obj, A

(logical add of data memory and accumulator)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj}, \text{A} \leftarrow \text{obj} \vee \text{A}$

(for post-increment)

$\text{HL} \leftarrow \text{HL} + 1$  or  $\text{XY} \leftarrow \text{XY} + 1$

### Description

Takes the logical add for the accumulator and the data memory specified by obj.

Results are written to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if  $\text{obj} \vee \text{A} = 0$

## OR obj, #i4

(logical add of data memory and immediate data)

### obj

For no post-increment:  $\$cur, [HL], [XY], E:[HL], E:[XY]$

For post-increment:  $[HL+], [XY+], E:[HL+], E:[XY+]$

### Function

$obj, A \leftarrow obj \vee i4$   
(for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

Takes the logical add for the immediate data and the data memory specified by obj. Results are written to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if  $obj \vee i4 = 0$   
then  $Z \leftarrow 1$   
else  $Z \leftarrow 0$   
(for post-increment)  
if  $HL + 1 = 0$  or  $XY + 1 = 0$   
then  $G \leftarrow 1$   
else  $G \leftarrow 0$

## POP HL

(restores flag registers, accumulator and HL register)

### Function

RSP  $\leftarrow$  RSP - 1, {FLAG, A, HL}  $\leftarrow$  (RSP)

### Description

Decrements the register stack pointer, then restores the register stack content to the flag registers (G, C, Z), accumulator and HL register.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if Z = 1 when PUSH HL executed,  
then Z  $\leftarrow$  1  
else Z  $\leftarrow$  0

if C = 1 when PUSH HL executed  
then C  $\leftarrow$  1  
else C  $\leftarrow$  0

if G = 1 when PUSH HL executed  
then G  $\leftarrow$  1  
else G  $\leftarrow$  0

| Z                     | C                     | G                     |
|-----------------------|-----------------------|-----------------------|
| <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

## POP XY

(restores extra bank register, current bank register and XY register)

### Function

$RSP \leftarrow RSP - 1, \{EBR, CBR, XY\} \leftarrow (RSP)$

### Description

Decrements the register stack pointer, then restores the register bank stack content to the extra bank register, current bank register and XY register.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | — | — |

### Codes/Cycles

## PUSH HL

(saves flag registers, accumulator and HL register)

### Function

$(RSP) \leftarrow (\text{FLAG}, A, HL), RSP \leftarrow RSP + 1$

### Description

Saves the flag registers (G, C, Z), accumulator and HL register to the register stack, then increments the register stack pointer.

### Flags

Flags affected by execution of this instruction

| Z | C | G |
|---|---|---|
| — | — | — |

### Codes/Cycles

## **PUSH XY**

(saves extra bank register, current bank register and XY register)

### **Function**

$(RSP) \leftarrow \{EBR, CBR, XY\}$ ,  $RSP \leftarrow RSP + 1$

### **Description**

Saves the extra bank register, current bank register and XY register to the register stack, then increments the register stack pointer.

### **Flags**

Flags affected by execution of this instruction

| <b>Z</b> | <b>C</b> | <b>G</b> |
|----------|----------|----------|
| —        | —        | —        |

## ROL obj

(rotate left)

**obj**

For no post-increment: sfr, \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

**Function**

$\boxed{\text{obj}_3 \leftarrow \text{obj}_2 \leftarrow \text{obj}_1 \leftarrow \text{obj}_0 \leftarrow C \leftarrow, A \leftarrow \text{obj}}$

(for post-increment)

$\text{HL} \leftarrow \text{HL} + 1$  or  $\text{XY} \leftarrow \text{XY} + 1$

**Description**

Rotates the data memory content specified by obj one bit left. The carry flag is stored to data memory LSB, and the MSB to the carry flag. After rotation the data memory content is stored to the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

**Flags**

Flags affected by execution of this instruction

Flag change conditions

if  $\text{obj}_3 = 1$  (obj bit 3 = 1 before instruction execution)

then  $C \leftarrow 1$

else  $C \leftarrow 0$

if  $A = 0$

then  $Z \leftarrow 1$

else  $Z \leftarrow 0$

(for post-increment)

if  $\text{HL} + 1 = 0$  or  $\text{XY} + 1 = 0$

then  $G \leftarrow 1$

else  $G \leftarrow 0$

## ROR obj

(rotate right)

### obj

For no post-increment: sfr, \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\rightarrow \text{obj}_3 \rightarrow \text{obj}_2 \rightarrow \text{obj}_1 \rightarrow \text{obj}_0 \rightarrow C$ , A  $\leftarrow$  obj  
(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

Rotates the data memory content specified by obj one bit right. The carry flag is stored to data memory MSB, and the LSB to the carry flag. After rotation the data memory content is stored to the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

## RT

(return from subroutine)

### Function

$PC \leftarrow (SP) + 1$ ,  $SP \leftarrow SP - 1$

### Description

The PC (program counter) value saved to the call stack by the CAL or LCAL instruction is incremented by one then set to the PC. The call stack pointer is then decremented.

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   | Machine Cycle |   |

## RTI

(return from maskable interrupt processing routine)

### Function

$PC \leftarrow (SP) + 1$ ,  $SP \leftarrow SP - 1$ ,  $MIE \leftarrow 1$

### Description

The PC (program counter) value saved to the call stack when a maskable interrupt was generated is incremented by one then set to the PC. The call stack pointer is then decremented. MIE is set to 1 to enable maskable interrupts again. The RTI instruction is used as the instruction to return from a maskable interrupt routine.

### Codes/Cycles

| Operand | Instruction Code |    |    |    |    |    |   |   |   |   |   |   |   |   |   | Machine Cycle |   |

## **RTNMI**

(return from non-maskable interrupt processing routine)

### **Function**

$PC \leftarrow (SP) + 1$ ,  $SP \leftarrow SP - 1$ ,  $MIE \leftarrow$  Pre-interrupt MIE state

### **Description**

The PC (program counter) value saved to the call stack when a non-maskable interrupt was generated is incremented by one then set to the PC. The call stack pointer is then decremented. The pre-interrupt state is reset in MIE. The RTNMI instruction is used as the instruction to return from a non-maskable interrupt routine.

### **Codes/Cycles**

## SBC obj, A

(data memory and accumulator subtraction with carry)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj } A \leftarrow \text{obj} - A - C$

(for post-increment)

$HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The accumulator and carry flag are subtracted from the data memory specified by obj, and the results stored to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

## SBCD obj, A

(data memory and accumulator subtraction with carry with decimal adjust)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  decimal adjust {obj - A - C}

(for post-increment)

HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

The accumulator and carry flag are subtracted from the data memory specified by obj, and the results stored to data memory and the accumulator if there is no resulting borrow. If there is a borrow, the decimal adjustment AH is added and the results stored to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

## SBCJ obj, n

(data memory subtraction with carry with base-n adjust)

### obj

For no post-increment:  $\$cur, [HL], [XY], E:[HL], E:[XY]$

For post-increment:  $[HL+], [XY+], E:[HL+], E:[XY+]$

### Function

$obj, A \leftarrow n \text{ adjust } \{obj\text{-}C\}$  (Even number from 2 to 16)

(for post-increment)

$HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The accumulator and carry flag are subtracted from the data memory specified by obj, and base-n adjustment completed. The results are stored to data memory and the accumulator. If the result of base-n adjustment is 0FH, the adjustment n is added. n is an even value from 2 to 16. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction

Flag change conditions

if the base-n adjustment = 0

then Z  $\leftarrow$  1

else Z  $\leftarrow$  0

if an underflow results, C  $\leftarrow$  1, else C  $\leftarrow$  0

(for post-increment)

if  $HL + 1 = 0$  or  $XY + 1 = 0$

then G  $\leftarrow$  1

else G  $\leftarrow$  0

## SJMP radr8

(PC relative branch)

### Function

PC  $\leftarrow$  NextPC + radr8  
(However,  $-128 \leq \text{radr8} \leq +127$   
Next PC is the address (PC+1) after the instruction)

### Description

The content of radr8 is added to NextPC and the program branched.  
The destination is a range from -128 to +127 from the NextPC address. The 8 bits in the instruction code ( $a_7$  to  $a_0$ ) correspond to radr8, and  $a_7$  (8th bit) is the sign indicating the direction of displacement from the next address.  
Branches across program memory page boundaries are possible.  
The Assembler can directly specify addresses within branch range (labels) instead of radr8.

## SUB obj, A

(data memory and accumulator subtraction)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj - A  
(for post-increment)  
HL  $\leftarrow$  HL + 1 or XY  $\leftarrow$  XY + 1

### Description

The accumulator is subtracted from the data memory specified by obj, and the results stored to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

## SUB obj, #i4

(data memory and immediate data subtraction)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj - i4  
 (for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

The immediate data i4 is subtracted from the data memory specified by obj, and the results stored to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

## XOR obj, A

(exclusive OR of data memory and accumulator)

### obj

For no post-increment: sfr, ¥cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

obj, A  $\leftarrow$  obj  $\vee$  A  
 (for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

A exclusive OR is executed for the accumulator and the data memory specified by obj, and the results written to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

## XOR obj, #i4

(exclusive OR of data memory and immediate data)

### obj

For no post-increment: \$cur, [HL], [XY], E:[HL], E:[XY]

For post-increment: [HL+], [XY+], E:[HL+], E:[XY+]

### Function

$\text{obj}, A \leftarrow \text{obj} \vee i4$   
(for post-increment)  
 $HL \leftarrow HL + 1$  or  $XY \leftarrow XY + 1$

### Description

A exclusive OR is executed for the immediate data and the data memory specified by obj, and the results written to data memory and the accumulator. For post-increment operations, the HL or XY register is incremented after execution.

### Flags

Flags affected by execution of this instruction  
Flag change conditions

if  $\text{obj} \vee i4 = 0$   
then  $Z \leftarrow 1$   
else  $Z \leftarrow 0$

(for post-increment)

if  $HL + 1 = 0$  or  $XY + 1 = 0$   
then  $G \leftarrow 1$   
else  $G \leftarrow 0$
