

Piezoresistive Pressure Sensors

for Automotive R&D, Test Applications

Type 4260A...
4262A...

A versatile high performance pressure sensor that will operate in harsh test environments where temperature extremes, high vibration and shock levels are present.

- Pressure ranges from -14.7 ... 5000 psi
- 0.05 % FS accuracy
- 0.1 % FS stability per year
- Temperature compensated -40 ... 250 °F
- 300 % proof pressure
- Fast response time
- mV, V and mA electrical output options
- Many voltage output options, 1 ... 5,
0.5 ... 4.5, 0 ... 10 etc.. (3 and 4-wire)
- Intrinsically Safe

Applications

Type 4260/62A... series from Kistler is well suited for demanding pressure applications in the R&D, engine test, road test, component test and other test applications supporting the automotive, aerospace and industrial markets.

Engine and powertrain test

- Engine oil and coolant pressures
- Engine fuel
- Inlet and exhaust pressures
- Barometric pressure
- Transmission pressures

On vehicle test

- Engine oil and coolant pressures
- Engine fuel
- Air conditioning
- Brakes and hydraulics
- Inlet and exhaust pressures

Component and sub-system testing

- Auxiliary power units
- Air conditioning systems
- Fuel, water and oil pumps
- Suspension systems
- ABS test stands
- High pressure fuel control systems
- Flight test
- Leak testing

CE Compliant Information

EMC compliant to EN61326-1:2001/A1/A2 industrial locations compliant with Pressure Equipment Directive (PED) 97/23/EC a Category 1 Pressure Accessory.

Note: "Pressure Range" is equivalent to max. working pressure (PS) as referred to in the PED.

Description

Type 4260/62A... series sensor is based upon proven Kistler piezoresistive sensing technology that has been continually developed and refined since the early 1970's. A silicon sensing element is mounted within a high integrity seal assembly that is fully isolated from the pressure media by a welded 316L stainless steel or Hastelloy™ diaphragm. The silicon sensing element exhibits high performance for stability and repeatability, extremely important parameters for the Test Engineer.

The pressure sensing assembly features a unique sealing method (US Patent 7, 373, 827) that enables the sensor to withstand multiple cycles without fatigue that is especially useful in cyclic applications. This design also enables flexibility in choice of pressure connections without the use of adaptors or 'O' rings.

Surface mount electronics condition the output from the silicon sensing element and provide temperature compensation. Additional electronic circuit boards can then be added to configure the electrical output for a wide choice of voltage and mA outputs. As a result, Type 4260/62A... series can be quickly

configured at the factory to the customer's choice of electrical output to suit a variety of data acquisition systems. Additionally, non-interactive zero and span calibration adjustments can be provided.

EMC protection, reverse polarity, power supply regulation, over voltage and short circuit protection is provided, ensuring Type 4260/62A... series is well suited for the harsh test environments that are commonplace in the automotive and aerospace test markets.

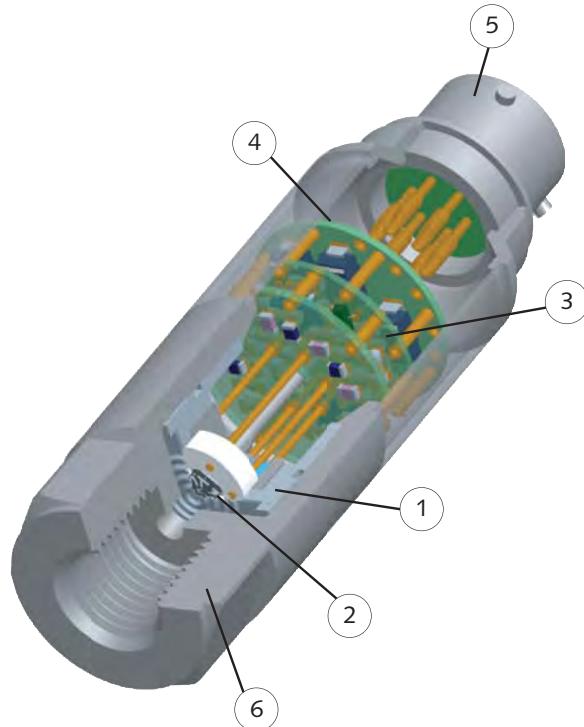

Type 4260/62A... series is available with options for use in ATEX zoned hazardous area: Zone 0, intrinsically safe II 1G and Zone 2, non-incendive II 3G. CSA certified 2009 2053869 single seal.

Type 4260/62A... series is stocked in popular types and pressure ranges. Prior to shipping the sensor is adjusted to suit the required pressure range and engineering units, the zero and span checked and the sensor finally completed with a choice of electrical and pressure connections.

Finally, every Type 4260/62A... series sensor is fully tested over both pressure and temperature to ensure compliance to the specifications. This data is available for each sensor and is traceable to ISO 17025 and NIST.

Construction

- 1 Pressure capsule: high integrity 316L stainless steel glass to metal seal with Hastelloy™ or 316L stainless steel isolation diaphragm.
- 2 Sensing element: etched cavity, micro-machined silicon with ion implanted strain gauges.
- 3 Conditioning electronics: surface mount electronics that are fully encapsulated for high vibration and shock environments.
- 4 Protection: circuit board includes RFI/EMI protection, reverse polarity, over voltage and short circuit protection.
- 5 Electrical connection: choices can be specified by the customer.
- 6 Pressure connection: wide choice of welded pressure fittings.

Calibration Data

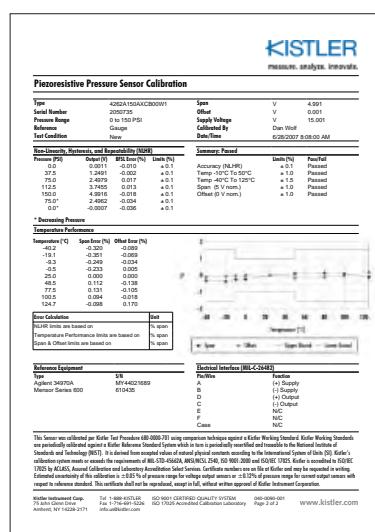

Calibration data is available for all Type 4260/62A... series sensors and is supplied as standard with all premium accuracy sensors.

The following information is provided on the calibration sheet and provides a comprehensive summary of the actual performance of the sensor compared to specification:

- Non-linearity, hysteresis & repeatability at room temperature
- Zero setting and span setting at room temperature
- Thermal zero shift and thermal span shift through the compensated temperature range
- Pass/fail summary
- Electrical connection details

All data is traceable to the National Institute of Standards and Technology (NIST) and is ISO17025 certified.

Type 4260/62A... series can be provided with custom calibrations for specific applications.

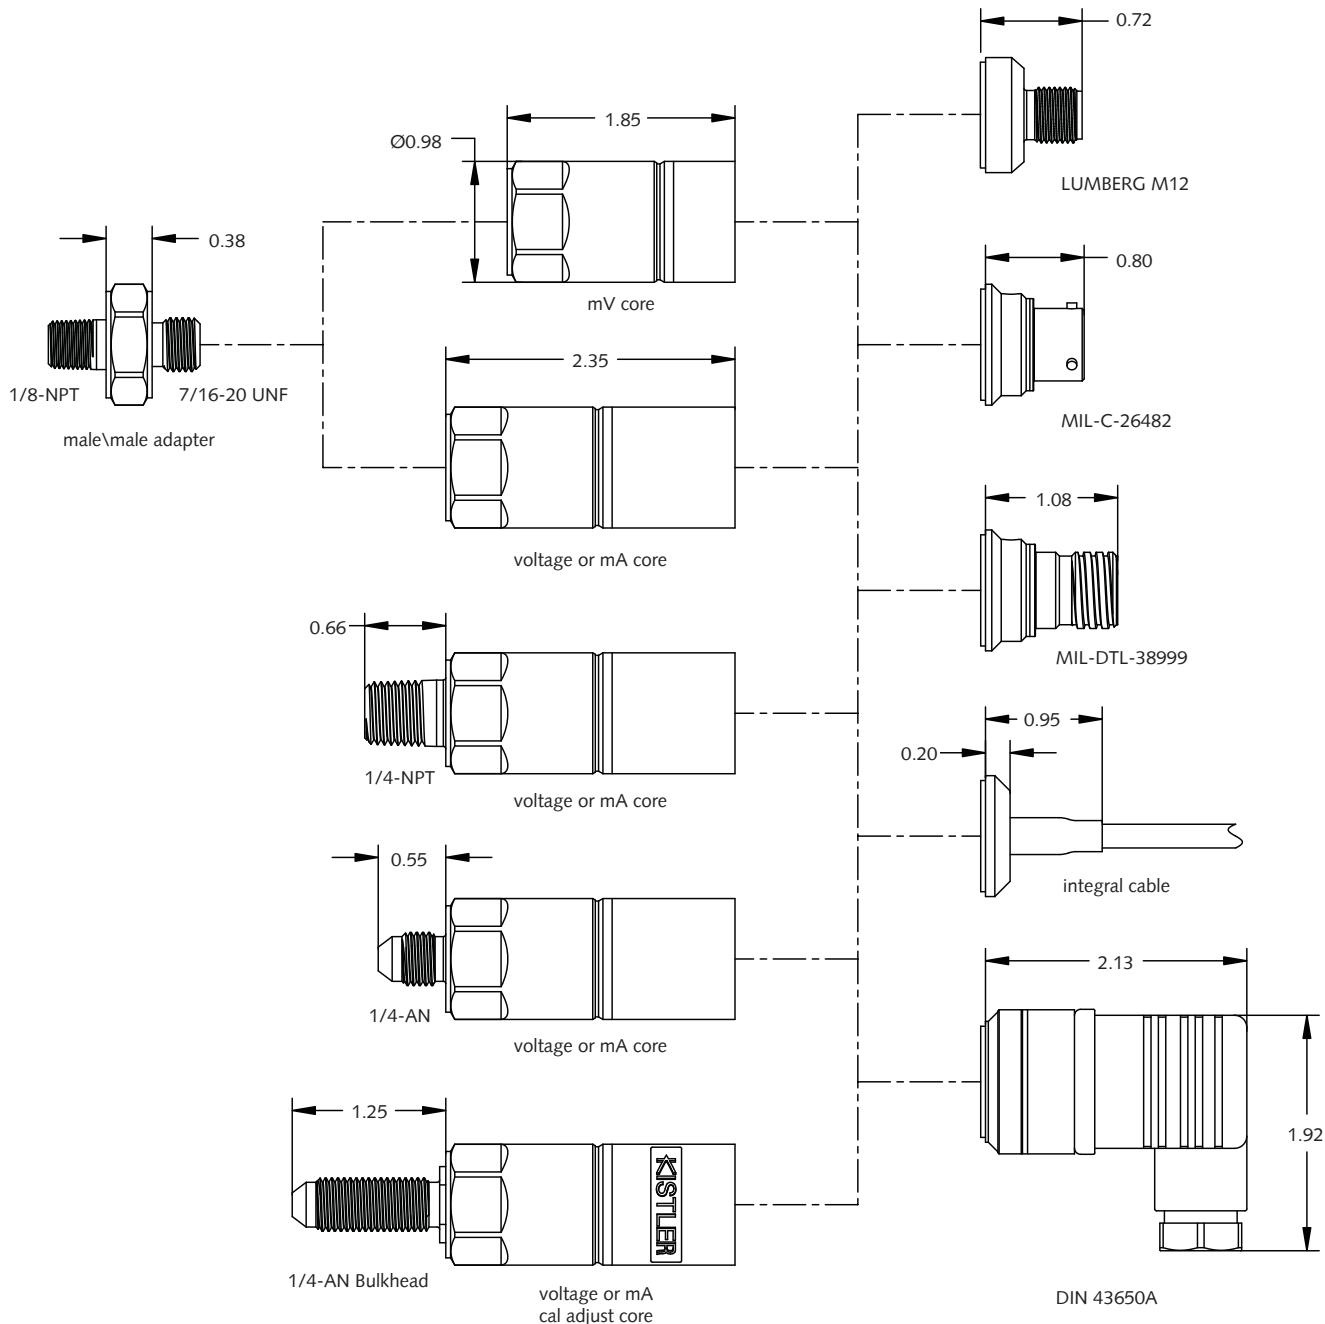

**Special Calibration**

Custom calibrations include improved Static Error Band, improved temperature effects over custom temperature limits and improved zero and span setting tolerances. Examples of improved temperature errors (thermal zero and thermal span shift) include:

- 0.5 % FS over 14 ... 122 °F
- 1.0 % FS over 14 ... 255 °F
- 1.0 % FS over -40 ... 122 °F

Contact Kistler to discuss special calibration requirements.

(Electrical Connector Options B & C Only)**

Pin (connector B)	Pin (connector C)	Connection
A	1	(+) Supply
C	3	(-) Output (-) Supply
E	5	Case ground*
B, D, F	2, 4, 6	Not connected

**Option R: Din Connector, 2-Wire
(Electrical Connector Option D Only)**

Pin	Connection
1	(+) Supply
3	(-) Output/(-) Supply
4	Case ground (DC)
2	Not connected

Loop Resistance Chart**Load Chart for 4 ... 20 mA (loop powered current output)**

Key	Description
V _s	Voltage at the terminal of transmitter
R _L	Load resistance

Min. required working voltage is given by

$$V_s = (0.02 \times R_L) + 9V$$

Page 11/12

Connections
A ... F MIL-C-26482
1 ... 6 MIL-DTL-38999
