PERFORMANCE	Sensitivity	mV/decade concentration change (0.5% to 5% CO_2)	6 to 10
	Response time	t_{90} (s) for mV change (20°C)(0.5% to 5% CO_2)	2-4 mins
	Zero	E_0 @ 5000ppm CO_2	-30 to +30mV
	Resolution	RMS noise (ppm equivalent) @ 5,000ppm CO_2	100
	Range	CO_2 concentration	0.2% to 95%
	Linearity	see Figure 3	Logarithmic

LIFETIME	Zero drift	(mV) E_0 change/day in lab air	± 3
	Sensitivity drift	mV/decade/month change in lab air, monthly test	<1
	Operating life	months until 80% original signal (24 month warranted)	>24

ENVIRONMENTAL	Temperature range	°C	10 to 35°C
	Pressure range	kPa	80 to 120
	Humidity range	% rh continuous	15 to 95

KEY SPECIFICATIONS	Storage period	months @ 0 to 20°C (stored in original container)	6
	Input	Impedance of op amp input	$>10^8 \Omega$

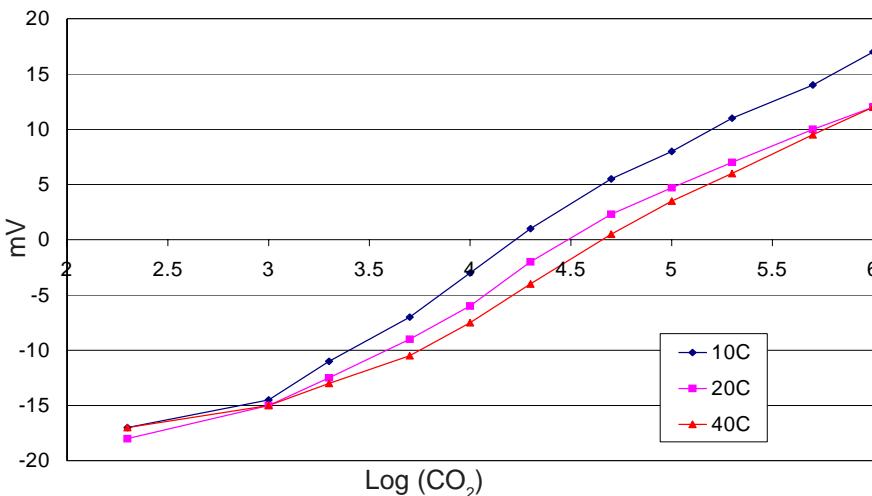

NOTE: all sensors are tested at ambient environmental conditions, with 10 ohm load resistor, unless otherwise stated. As applications of use are outside our control, the information provided is given without legal responsibility. Customers should test under their own conditions, to ensure that the sensors are suitable for their own requirements.

Technical Specification

CO2-D1 Performance Data

Figure 2 Mastercurve

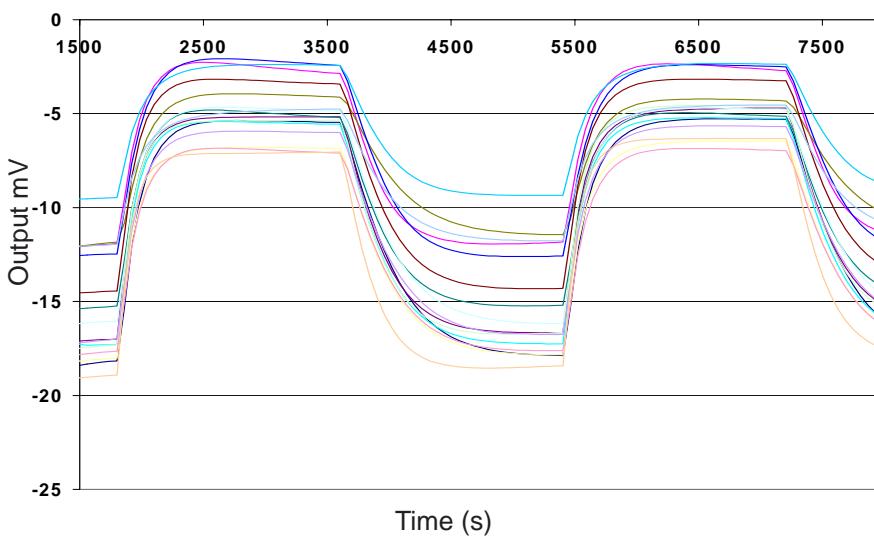

The CO2-D1 is a potentiometric sensor and responds over four decades of CO₂ concentration.

Sensitivity (mV/decade concentration) is not constant, it changes with concentration: sensitivity increases at higher concentrations.

Sensitivity remains stable with time, but the offset voltage (E_0) will shift, so regular zeroing is advised.

Temperature affects E_0 but not the sensitivity from 10° to 40°C.

Figure 3 Hysteresis

Sensors were exposed first to 5000 ppm CO₂ then 5% CO₂ for 30 minutes.

Sensors return to the initial voltage with a fast initial response, followed by a slower stabilisation to the final voltage.

CO2-D1 Sensor Conditioning PCB

The CO2-D1 is a potentiometric electrochemical gas sensor which responds to carbon dioxide as a gas ion selective electrode. The potential that is generated must not be measured using low impedance circuitry. Alphasense has developed a simple buffering circuit that conditions the potential to protect the CO2-D1 from damage.

This conditioning board allows customers during validation and single users (research groups) to use a simple datalogger or DVM to monitor the sensor without causing damage to the sensor.

Power: CR2032 Li coin cell (3V) (20mm dia, 3.2mm ht. 165mA) located under the board

Power consumption: Approx. 30uA giving between 6 and 12 months continuous use

Output socket: 2-way screw terminal
Marked + and -. Suitable for feeding directly into a datalogger or DVM
