Infrared Sensing

For Secure Homes, Healthier Families and Energy Savings.

INFRARED SENSING TECHNOLOGIES – FOR A HEALTHIER, CLEANER AND SAFER TOMORROW.

PerkinElmer's infrared sensing technologies are playing a vital role in creating a healthier, cleaner and safer tomorrow. PerkinElmer has gained worldwide recognition for the design and production of high performance pyroelectric detectors,

thermopile detectors and sensor modules which – every day – contribute to safeguarding homes, saving energy, and providing comfort. From motion and presence detection to gas detection, thermometry and indoor climate control applications, PerkinElmer's IR sensing technology and growing product range are meeting your challenges. We are sensing what you need – for the better.

**Sensing what you need –
from motion sensors for secure homes
to gas detection systems,
indoor climate control systems and
ear thermometers.**

Our Infrared Sensing Solutions provide

- Excellent performance
- Strong reliability
- Innovative features

We support our products with

- Application expertise
- Suitable features and functions
- Special optical filters for gas sensing

■ WORLDWIDE COMMITMENT TO YOUR CHALLENGES

You can depend on PerkinElmer's world-class global network of production, R&D, and distribution centers including Montreal, Canada; Wiesbaden, Germany; Singapore; Batam, Indonesia; and Shenzhen, China. We have customer service hubs on each continent to ensure just-in-time delivery. We believe in forging an intimate partnership in which we are communicating proactively with you and refining our forecasts of your requirements to better serve you.

We have the detection technologies and capabilities needed to enhance and accelerate your OEM designs. Our R&D groups are focusing on new products and capabilities for your new and emerging applications. We pride ourselves on deep applications expertise to respond to and anticipate your detection requirements. Feel confident that you can discuss your requirements with our engineers. We thrive on the your challenges and will always try to assist you with sincere assistance based on our know-how and experience.

■ UNPARALLELED QUALITY

The consistent quality of our products is the foundation for which we build our relationship with you. The global adoption of our detectors in a host of consumer products as well as medical, industrial and commercial applications is testimony to our quality commitment and to your confidence in us.

We implement cutting-edge quality assurance system and measures; SPC and reliability testing are standard procedures at PerkinElmer. Of course, everything begins with the quality of our raw materials. Inspection procedures transcend all processes and conclude with 100% final inspection for all major parameters. We maintain our certification to major quality and environmental standards, which are subject to regular audits. All of our factories have received certifications for ISO 9001, OHSAS 18001, NLF/ILO-OSH 2001.

Infrared Basics

All solid bodies when having temperatures above the absolute zero (-273°C) emit electromagnetic waves. The range of longer wavelengths beyond the visual spectrum is referenced as infrared radiation. The scientist Wilhelm Wien (1864 – 1928) described the relation between a solid body's temperature and its emitting peak wavelength by following equation:

$$\lambda_{\max} = 2898/T$$

T = Temperature in K (Kelvin)

λ = Wavelength in μm

Using this law we can calculate the specific peak emission wavelength of any material or body: A human body, of a surface temperature of approx. 35°C or 308 K gives a peak wavelength of $9.4\mu\text{m}$; a cat of 38°C temperature gives $9.3\mu\text{m}$. According to Max Planck (1858 – 1947) the intensity curve of all emitted wavelengths for a solid body is rather broad. For our example above this means we cannot distinguish human beings from the cat by their infrared spectrum.

For various temperatures of an ideal black body radiator the intensity curves of radiated energy versus wavelength are shown in graph 1.

A hot body of 2000 K emits a lot of energy, some in the visible light range (it glows red or white-hot), some in the infrared. A body of 500 K emits

radiation in the invisible part of the spectrum, the infrared range, which we can feel, but not see.

Infrared Detectors

With detectors for the infrared spectrum there are two major types classified by their physical principles: photon detectors and thermal detectors. Photon detectors convert radiation directly into electrons, thermal detectors receive radiation, using it to raise the temperature of a sensing material which changes its electrical property in response to the temperature rise. Photon detectors such as photodiodes and phototransistors range from visible to near infrared, whereas thermal detectors have a broad response from below visible light up to over $100\mu\text{m}$. Fitted with special infrared windows as spectral filters they can work in the mid to far infrared range without ambient visible light interference.

Optical Properties

With respect to optical parameters of detectors and sensors, there are some interesting items to be mentioned: the optical bandwidth, transmission and blocking characteristics of the optical filter and, as major selection criteria, the sensor field of view, and performance of the detector within the field of view. The corresponding charts are given for the various sensors and types.

Filters for Infrared Sensors

The spectral range of sensitivity for thermal detectors is defined by the filter window. Common applications in infrared reference wavelengths use from 2 to $20\mu\text{m}$. Infrared windows for pyrometric applications exploit the atmospheric window of 5 – $14\mu\text{m}$, which is served by our standard filter. Long range pyrometers apply a sharp cut-on/cut-off window of 9 – $14\mu\text{m}$ (G9) as per graph 2. For the special application of gas sensing by infrared absorption we offer narrow band filters to detect specific gas absorption lines. The appropriate narrow band optical filters enable detection of carbon monoxide, carbon dioxide, natural gas and other environmental gases, as well as some technical gases.

In graph 2 we show the light transmittance graph for standard infrared window and the pyrometric window "G9". As to narrow band infrared filters, the range of available filters and specifications is given in table 1.

Pyroelectric Infrared Detectors

Pyroelectric Effect

Since ancient times the pyroelectric effect has been known as a property of ferroelectric materials. It is based on a specific behavior of dielectric materials, the phenomenon of a permanent electrical polarization. When changing temperature of such materials, this polarization will increase, or decrease, so we observe a charge displacement. This pyroelectric effect is the basic principle for detectors that can recognize temperature variations. The characteristic value for the permanent polarization, called the pyroelectric coefficient, disappears above the Curie point. The Curie temperature limits the operation temperature range for such detectors. Pyroelectric detectors do not require cooling.

Detector Design

Within our detectors, a thin slice of pyroelectric material is fitted with electrodes to form a capacitor. Incoming radiation will generate extremely low levels of thermal energy, so the pyroelectric current flow is rather small. It needs a circuit to convert this small current into a convenient signal. The traditional analog detectors apply a high ohmic resistor and a special low-leakage current FET to transform the high impedance of the detector material to a common output resistance. The pyroelectric element's capacitance and the high gate resistance of the FET form an RC circuit, as per graph 3, with a time constant of approx.

1 s., which makes the detector suitable for very low frequencies. PerkinElmer is the first to having introduced digital technology to pyroelectric detectors with its DigiPyro® family. Here, a special ADC circuit provides amplification, A/D conversion and interfacing to the outside electronics.

Detector Construction

The pyroelectric material is placed on a special pc-board which provides thermal and mechanical isolation for the delicate pyroelectric material and provides space for the gate resistor and the FET. The connections are made either by wire bonding or conductive bonding. The whole pc-board is placed on to a TO header and closed with a TO cap, which has the relevant optical filter window. The window possesses a special infrared transmission characteristic, selected for the detector application.

Pyro Characteristics

The most important electrical data of the IR-sensor are its responsivity, balance and noise. Sometimes it is also useful to refer to NEP or D^* .

Responsivity

The responsivity shows bandpass characteristics with a maximum at approx. 0.1 Hz radiation modulation. A typical curve "responsivity versus frequency" is indicated below as graph 4.

Responsivity is measured in V/W by means of a defined black body radiator. Responsivity refers to the active sensor area and is usually tested at 1 Hz modulation frequency unless specified differently.

Balance

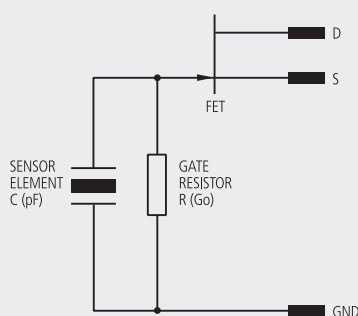

The balance of a dual element detector indicates the common mode rejection also called matching between the two elements. It is an important value for the performance of dual element detectors, applied in motion applications, as it is a measure for distinguishing between moving and fixed objects. It can be specified either in V/W or in % of responsivity.

Noise

The noise of the sensor consists of three parts: The basic thermal noise of the sensing material, the (Johnson) noise of the high ohmic resistor and the input noise of the FET. The total output of these three parts is rather stable for temperatures below 40° C. Above this temperature, noise increases exponentially with temperature as can be observed with typical active electronic components. Noise is given in μV peak-to-peak or zero-peak. Similar to the dependence of responsivity on frequency, the noise values decrease with frequency from approx. 0.15 Hz to 50 Hz., as per graph 5.

Electrical Configuration

Graph 4

Transfer Function

Graph 5

Responsivity, Noise vs. Frequency

Digital Pyrodetectors – A New Family

Pyroelectric detectors are AC type devices and give signals upon change of received infrared radiation. Until today, all available detectors are analog, i.e. they provide an analog signal output. PerkinElmer is the first to introduce a family of detectors which differ from previous generations by offering a digital signal output.

With the DigiPyro® family PerkinElmer is offering digital detectors for all these applications and configurations.

1.1 Integrated Electronics

The DigiPyro® series integrates the first stages of circuitry into the detector housing: Amplification of the signal, then the A/D conversion, which needs a voltage reference. Following an internal 10 Hz digital low pass filter the serial interface provides for the “direct link” communication which has a one wire bidirectional communication feature. The whole concept runs using its own internal oscillator, which determines the speed of the internal process. The direct link feature enables the user to have the host μC request the information and its response, so the host controls the communication speed.

1.2 From Analog to Digital

The DigiPyro® series is the first pyroelectric detector family to display information in Bit form as opposed to mV signals of analog detectors.

To give a measure for comparisons of traditional detectors to digital versions, the rule of thumb for signal levels versus bit information can be used:

- Resolution: $1 \text{ LSB} \approx 6.5 \mu\text{V}$
- Range: $0 \text{ to } 16383 \text{ Counts} \approx \pm 53.6 \text{ mV}$
- DC Offset: $8192 \text{ Counts} \approx 53.6 \text{ mV}$
- Noise: $6 \text{ Counts} \approx 39 \mu\text{V}$ (with bandpass)

In typical motion electronics the expected signal voltages range from $100 \mu\text{V}$ to mV values, so the digital signal may range up to approx. 100 bit-count. In gas detection, the output range of analog detectors is up to 2 mV, so the digital output may range up to 20 bit-count. It is most obvious that the dynamic range of the digital detector is wider than these mentioned levels and covers many other applications.

1.3 Digital Zero Signal Line

As the pyroelectric effect generates positive and negative signal amplitudes, the detector circuitry needs an electrical offset to be able to process such signals. In all analog circuitry this value is the offset voltage, which is usually subtracted after the first amplifier stage.

With DigiPyros, the amplification is included already, and the internal voltage reference provides for the required offset. As to the user this offset appears as a digital zero line at about 8000 bit-count, it may vary in series from one part to

the next. To recognize the zero line of the individual detector, the user may either use a digital bandpass or subtract the measured offset from the signal.

1.4 The Host Needs to Filter the Signal

The DigiPyro® does not include any processing intelligence inside, unlike most analog pyrodetectors the DigiPyro® uses a direct communication with the hosting microcontroller without any analog hardware filtering (only the previously mentioned low-pass filter). Thus it becomes necessary to implement all necessary filtering by software filters within the hosting microprocessor of the unit.

Applications for Pyroelectric Detectors

Pyroelectric detectors had originally been designed as single element types for non-contact temperature measurement. During further research, dual element types were developed with multi-facet mirrors or Fresnel lenses entering the field of motion detection, starting as passive intrusion alarm (burglar alarm, PIR), followed by automatic light switches and security lights and lamps. The same concept is also applied with some automatic door openers.

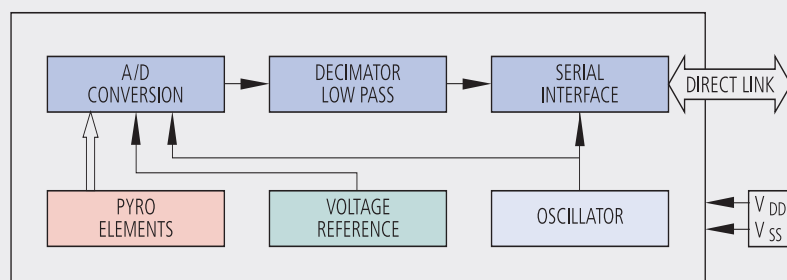

Today the environment and its protection is one of our most serious concerns. Features and instrumentation are required to measure and monitor all kinds of gas in our environment. One of the methods applied is the NDIR technique, a principle of measuring gas concentration by its absorption properties in the infrared range. Our detectors and sensors are a vital part of making our environment safer, more secure and healthy.

Most PIR motion detecting devices have been designed around dual element types, more advanced units apply four element “quad” type configurations.

For gas sensing single element with narrow band filters are applied in single or dual channel configuration.

Graph 6

DigiPyro®

Thermopile Detectors and Sensors

The Thermoelectric Effect

The thermoelectric effect today is known as reverse to the Peltier – or Seebeck effect. By applying a temperature difference to two junctions of two dissimilar materials A and B, a voltage U which is proportional to the temperature difference is observed.

Leopoldo Nobili (1784 – 1835) first used the thermoelectric effect for IR radiation measurement using a “pile” of Bismuth and Antimony contacts.

The measure of this effect is called the thermoelectric- or Seebeck-coefficient. For most conducting materials this coefficient is rather low, only few semiconductors possess rather high coefficients. Since the voltage of a single thermoelectric cell is very low, lots of such cells arranged in a series connection achieve a larger signal, making a “pile” of thermocouples.

Graph 7

Nobili's Thermopile

PerkinElmer Thermopile Design

Our thermopile sensors are based on the technology of silicon micromachining. The central part of a silicon chip is removed by an etching process, leaving on top only a $1\ \mu\text{m}$ thin sandwich layer (membrane) of $\text{SiO}_2/\text{Si}_3\text{N}_4$, which has low thermal conductivity. Onto this membrane thin conductors of two different thermoelectric materials (to form thermocouples) are deposited. Both conductors have alternatively junctions in the center of the membrane (hot junctions) and on the bulk part of the silicon substrate (cold junctions). A special IR-absorption layer covers the hot junctions creating the sensor's sensitive area.

Graph 8

The Seebeck Effect

When exposed to infrared radiation, the absorbed energy leads to a temperature difference between “hot” and “cold” contacts. According to the thermoelectric coefficient of the thermocouples a signal voltage is generated.

Thermopile Detector Construction

The sensor chip is mounted in good thermal contact on to a TO or SMD header. A transistor cap with infrared filter seals the sensor chip from the environment.

PerkinElmer's product portfolio includes detectors of various sizes, housings and infrared windows, and integrated sensors which include electronics that provide temperature compensation and calibration to a certain measurement range.

PerkinElmer offers unique constructions to deal with the thermal shock, referenced as ISO-thermal types.

Advantages

Thermopile detectors can sense continuous infrared radiation, thus they offer simpler design possibility for infrared measurements.

Thermopile Characteristics

The most important properties of the thermopile sensor are its responsivity, noise, field of view, response time, and for calibrated sensors, the temperature range.

Responsivity

The responsivity shows low pass characteristics with a cut off at approx. 30 Hz.

Responsivity is measured in Volt per Watt by means of a defined black body radiator. Responsivity data is usually quoted with respect to the active detector area, without the infrared filter. The data show the responsivity value, tested at 1 Hz modulation frequency.

Noise

The noise of the detector is dominated by the Johnson noise due to the resistance of the thermopile. Noise is given as RMS value in $\text{nV}/\sqrt{\text{Hz}}$.

Sensitivity

The data tables also mention sensitivity, as a characteristic output voltage versus target temperature at 25°C environmental temperature. The data are given with standard IR filter as per graph 2. Two parameters are given: $S(25/40)$ is 25°C environment, 40°C Black Body target and $S(25/100)$, which is 25°C environment, 100°C Black Body target. Sensitivity is depending on the field of view of the detector construction and its filter characteristics. An example can be seen in graph 9 for selected TPS series.

Graph 9

Sensitivity vs. Target Temperature

Thermistor

As temperature reference the thermopile detectors include a thermistor which senses the ambient or case temperature.

Reference Temperature Sensor

For exact measurements the temperature of the detector housing (cold thermopile contacts) must be known. A 30kOhm or 100kOhm thermistor inside the detector housing serves as the ambient temperature reference. The dependence of the resistance on temperature can be approximated by the following equation:

$$R_T = R_R \cdot e^{B \left(\frac{1}{T} - \frac{1}{T_R} \right)}$$

R_T NTC resistance in Ω at temperature T in K

R_R NTC resistance in Ω at rated temperature T_R in K

T Temperature in K

T_R Rated temperature in K (25°)

B B value, material-specific constant of NTC thermistor

e Euler number ($e = 2.71828$)

The actual characteristic of an NTC thermistor can be roughly described by the exponential relation. This approach, however, is only suitable for describing a restricted range around the rated temperature or resistance with sufficient accuracy. For practical applications a more precise description of the real R/T curve is required. Either more complicated approaches (e.g. the Steinhart-Hart equation) are used or the resistance/ temperature relation is given in tabulated form.

The Field of View

The most common use of thermopile detectors is non-contact temperature sensing. All target points within the field of view will contribute to the measurement signal. To meet requirements of different applications, PerkinElmer offers a broad range of sensors with different windows and optics.

The field of view data describe the dependence of signal from incident angles.

Graph 10

Field of View

The TPMS® family is available with different options on optical cap assemblies. We provide housing with aperture opening and filter window only, or with an infrared lens or also with integral mirror.

Such optical features define the viewing angle or as per definition the Field of View (FOV) of the sensor.

The FOV is defined as the difference of the incidence angles that allow the sensor to receive 50 % relative output signal, see also figure shown here, which is a sketch of a testing principle.

	Symbol	Parameter	Min	Typ	Max	Unit
Lens Type (L5.5)						
	FOV	Field of view		7	12	°
	OA	Optical axis		0	±3.5	°
	D:S	Distance to spot size ratio		8:1		
Integral Reflector Type (IRA)						
	FOV	Field of view		15	20	°
	OA	Optical axis		0	±2	°
Standard Aperture Type						
	FOV	Field of view		70	80	°
	OA	Optical axis		0	±10	°

Temperature Range

PerkinElmer offers sensors which include pre-amplification, ambient temperature compensation and calibration within a specific temperature range.

Thermopile Arrays

Further to its range of detectors and sensors, PerkinElmer offers line arrays and spatial arrays based on thermopile technology.

Applications for Thermopile Sensors

Thermopile sensors have been designed for non-contact temperature measurement. The signal of the sensor follows the radiation energy receipt by

the sensor. This enables the application of measuring surface temperatures without contact.

In many industrial process control units thermopile sensors are used to monitor temperature or to serve as overheating protection feature, all without contact to the hot object.

The thermopile technology is also suited for domestic appliances such as food monitoring during automated defrosting, warming-up or cooking.

As with our pyrodetectors, the thermopile detectors with specific filter windows are used as sensing components making our environment safer, more secure and healthy.

PYROELECTRIC DUAL ELEMENT DETECTORS FOR INTRUSION ALARM

PYROELECTRIC DETECTORS FOR INTRUSION ALARM ■

LHi 968, PYD 1398 – High-End Pyro

Applications

- Intrusion alarm
- High-end motion sensors

Features and Benefits

- TO-5 metal housing
- Improved EMI protection
- Improved WLI

Product Description

The LHi 968 series with standard Dual Element configuration is performance-proven in high-end applications. The LHi 968 design provides for a reduced sensitivity to EMI and excellent White Light Immunity (WLI). The PYD 1398 has higher RF immunity and is optionally available with grading for lower white light sensitivity.

PYROELECTRIC FOUR ELEMENT DETECTORS FOR INTRUSION ALARM

PYROELECTRIC DETECTORS FOR INTRUSION ALARM ■

LHi 1148, PYQ 1488 – High-End Pyro

Applications

- Intrusion alarm
- Dual channel systems
- High-end motion sensors

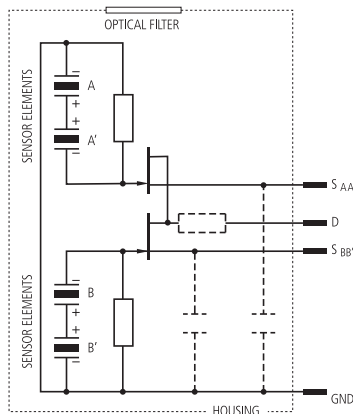

Features and Benefits

- TO-5 metal housing
- Dual channel
- Reverse/equal polarity
- RF protection option

Product Description

The LHi 1148 series with four element “Quad” configuration offers two independent dual element signals with opposite polarity. This enables separate signal processing option for the two channels to reduce common-mode RF influence and thermal effects.

For ceiling mount applications, we offer the PYQ1488 which has the dual element pairs arranged in a diagonal geometrical arrangement. This enables presence detection without any preference of direction.

PYROELECTRIC DUAL ELEMENT DETECTORS FOR MOTION SENSING

PYROELECTRIC DETECTORS FOR MOTION SENSING ■

LHi 778, LHi 878, PYD 1388 – Low Cost Pyro

Applications

- Auto light switch
- Wall switch
- Auto lamps

Features and Benefits

- TO-5 metal housing
- Different window sizes
- EMI protection for PYD1388

Product Description

This low cost Dual Element detector range offers standard TO-5 housings with different window sizes. The LHi 778 has a smaller window for minimal cost. The PYD 1388 has an additional EMI protection option.

All dimensions in mm

PYROELECTRIC DUAL ELEMENT DETECTORS FOR MOTION SENSING

PYROELECTRIC DETECTORS FOR MOTION SENSING ■

LHi 874, LHi 944 – Low Profile Pyro

Applications

- Auto light switch
- Wall switch
- Auto lamps with 180° FOV using 2 detectors

Features and Benefits

- TO-39 metal housing
- Different window sizes
- EMI protection option

Product Description

These low profile TO-39 detectors are very well suited with two detectors arranged in one common sensing unit for up to 180 degree view, with an EMI protection in LHi 944.

PYROELECTRIC FOUR ELEMENT DETECTORS FOR CEILING MOUNT

LHi 1128, PYQ 1398

Applications

- Ceiling mount alarms
- Ceiling mount light switch

Features and Benefits

- TO-5 metal housing
- Different window sizes
- Single channel output

Product Description

This series of four element "Quad" detectors provides all four elements connected to one common output. This configuration enables specific applications in ceiling mount location when applied with suitable lens or mirror optics designs. Two different window options are provided: Large window or standard rectangular window size. For better EMI protection, the built-in capacitor option is available.

MINIATURIZED DUAL ELEMENT PYRODETECTORS FOR MOTION SENSING

PYROELECTRIC DETECTORS FOR MOTION SENSING ■

PYD 5131 – Analog Pyro

Applications

- Auto light switch
- Wall switch

Features and Benefits

- TO-46 metal housing

Product Description

This range of pyrodetectors features a miniaturized Dual Element pyro in TO-46 housing. The small housing in connection with a reduced element size and spacing provides potential for reduced-size optics and thus smaller, more discrete, motion detection unit designs.

PYD 5131 – Analog Pyro

MINIATURIZED DUAL ELEMENT PYRODETECTORS FOR MOTION SENSING

PYD 5731 – DigiPyro®

Applications

- Auto light switch
- Wall switch

Features and Benefits

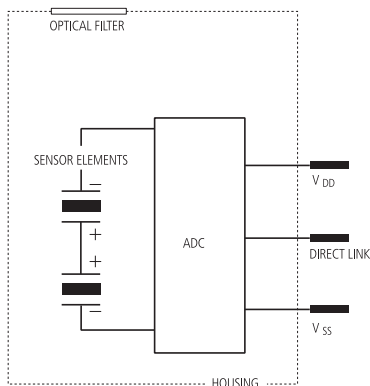

- TO-46 metal housing

Product Description

With the PYD 5731 PerkinElmer extends the emerging DigiPyro® family to bring all-digital processing to miniaturized detector designs. The PYD 5731 offers the same direct link interface as the regular PYD 1998 DigPyro®. It features a miniaturized Dual Element pyro in TO-46 housing.

DIGITAL DUAL ELEMENT PYROS FOR MOTION SENSING

PYD 1978, PYD 1988, PYD 1998 – DigiPyro®

Applications

- Passive intrusion alarm
- Auto light switch
- Auto lamps

Features and Benefits

- TO-5 metal housing
- Digital direct link
- Different window sizes
- Excellent EMI protection

Product Description

The DigiPyro® detector range in TO-5 housing includes 3 variations of Dual Element types, each with a different window size. The element configurations are identical, as well as the internal electronic circuits. Whereas the PYD 1978 represents the lower-cost version with a small window, the PYD 1998 is provided as the superior type in terms of White Light Immunity (WLI) performance and field of view. The output signals are communicated in one 15-bit digital bit stream output via a single wire “direct link” connection to a suitable host microprocessor.

DIGITAL PYROELECTRIC FOUR ELEMENT DETECTORS FOR MOTION SENSING

PYQ 2898 – DigiPyro® Dual Channel

Applications

- Passive intrusion alarm
- High-end motion sensing
- Ceiling mount sensors

Features and Benefits

- Digital direct link
- Excellent EMI protection

Product Description

This family of DigiPyro® detectors in TO-5 housing includes serial signal output, which provides two signal outputs of the 2 element pairs and an additional temperature reference signal. All 3 channels are part of one 42-bit digital bit stream output via a single wire “direct link” connection to a suitable host microprocessor.

DIGITAL PYROELECTRIC FOUR ELEMENT DETECTORS FOR MOTION SENSING

PYQ 5868 – DigiPyro® Dual Channel

Applications

- Passive intrusion alarm
- High-end motion sensing
- Ceiling mount sensors

Features and Benefits

- Digital direct link
- Different element configurations
- Excellent EMI protection

Product Description

The PYQ 5868 series with “Quad” configuration offers two independent dual element signals in a diagonal geometric arrangement. For ceiling mount applications with suitable ceiling mount design optics, this enables separate signal processing for the two channels to provide signal levels independent of movement direction. The PYQ 5868 offers a wide field of view due to its large window.

SMART PYROELECTRIC DETECTORS FOR SIMPLE MOTION SENSING

PYD 1096 – Dual Element “Smart DigiPyro®”

Applications

- Simple motion switches
- Auto light switch
- Wall switch

Features and Benefits

- TO-5 metal housing
- All electronics included

Product Description

The Smart DigiPyro® series offers a complete motion detector solution, with all electronic circuitry built into the detector housing. Only a power supply and power-switching components need to be added to make the entire motion switch, a timer is included. The series has versions which can include ambient light level and sensitivity adjustments.

All dimensions in mm

SINGLE ELEMENT PYROS FOR GAS MONITORING

LHi 807, PYS 4198 – High Sensitivity Pyro

Applications

- Gas sensing and monitoring

Features and Benefits

- TO-5 metal housing
- Selection of narrow band filters
- Thermal compensation

Product Description

The LHi 807 TC series has become a standard solution for gas-sensing applications. It is available with a range of narrow band filters, as specified on page 7 of this catalog for various gas species. The LHi 807 is usually supplied with temperature compensation by a separate “blind” sensing element. Similar features and benefits are included with the PYS 4198 which has large element size of 2 x 2 to offer more signal for non-focused optical systems. It is offered with the thermal compensation element for compensation of thermal effects caused by temperature changes of the housing.

PYRODETECTORS FOR GAS MONITORING AND MEASURING

PYS 3228, PYS 3428 – Dual Channel Pyro

Applications

- Gas sensing and monitoring

Features and Benefits

- TO-5 metal housing
- Dual channel output
- Each channel with individual filter window
- Selection of narrow band pass filters
- Thermal compensation option
- EMI protection option

Product Description

As successor of the LHi 814 series the PYS 3228 dual channel detectors have become standard for gas sensing applications, with two individual elements of size 1.5 x 1.5 and additional temperature compensation. They are available with a range of narrow band pass filters, as specified on page 7 in combination with a reference filter.

The same features are included with the PYS 3428, which offers additional EMI protection by internal capacitors.

PYRODETECTORS FOR GAS MONITORING AND MEASURING

PYS 3828 – Dual Channel DigiPyro®

Applications

- Gas sensing and monitoring

Features and Benefits

- Digital output
- Two optical channels
- Temp. reference channel
- Temperature compensated elements
- Selection of narrow band pass filters
- TO-5 metal housing

Product Description

PerkinElmer extends the family of DigiPyro® detectors to applications in gas sensing. This series includes a special triple channel version, in which two channels having their individual optical (narrow band) windows and an additional temperature reference signal are provided. All 3 channels are output in one 42-bit digital bit stream communicated via a single wire “direct link” interface to a suitable host microprocessor.

All dimensions in mm

SINGLE ELEMENT PYROS FOR GAS MONITORING AND MEASURING

PYROELECTRIC DETECTORS FOR GAS MONITORING ■

PYS 3798 – DigiPyro®

Applications

- Gas sensing and monitoring

Features and Benefits

- Digital output
- Internal temperature reference
- TO-5 metal housing
- Selection of narrow band pass filters

Product Description

PerkinElmer extends the family of DigiPyro® detectors to applications in gas sensing. The PYS 3798 is the digital equivalent to the analog LHi 807. It includes the additional temperature reference as a separate output. The two signals are presented in one 28-bit digital bit stream communicated via a single wire “direct link” interface to a suitable host microprocessor.

PYS 3798 – DigiPyro®

Main Parameter	Symbol	PYS 3798	Unit	Remark
Responsivity, min.	R_{min}	2.2	kV / W	$f = 1 \text{ Hz}$
Responsivity, typ.	R	3.5	kV / W	$f = 1 \text{ Hz}$
Match, max.	M_{max}	-	%	
Noise, max.		80	μV_{pp}	0.4 ... 10 Hz / 20° C
Field of view, horizontal	FoV	135°		Unobstructed
Field of view, vertical	FoV	122°		Unobstructed
Operating voltage	V_{DD}		V	
Supply current	I_{DDmax}	15	μA	$V_{DD} = 3.3 \text{ V}$
Digital Data				
Serial interface update time	t_{REP}	13	ms	
ADC resolution		14	Bits	Max. count = $2^{14} - 1$
Output data format		2 x 14	Bits	
ADC sensitivity		6 ... 7	$\mu V/\text{count}$	
ADC output offset		7000 ... 9200	Counts	
ADC output offset, typ.		8192	Counts	
Temperature Reference				
Gain (temperature)		80	Counts/K	-20° C to +80° C
Linearity		-5 ... +5	%	-20° C to +80° C
Filter, Signal Processing				
Digital filter cut off		10	Hz	see note 1)

1) A digital bandpass filter is recommended to cut off output offset.

THERMOPILE DETECTORS FOR GAS SENSING

TPD 1T 0515, TPD 1T 0625 – High Sensitivity Thermopile

Applications

- Gas sensing and monitoring

Features and Benefits

- High sensitivity
- TO-5 metal housing
- Thermistor included
- Narrow band pass filters

Product Description

These two thermopile detectors are specially designed for high signal output level. They are equipped with an internal thermistor as temperature reference for thermopile temperature compensation. Both series are made in TO-5 housing with a square window. They can be obtained with either a standard IR window or with a narrow band pass filter window as per page 7 of this catalog. With the narrow band pass filters, these detectors are an excellent choice for applications of gas monitoring and detection.

Field of View

TPD 1T 0515, TPD 1T 0625 – High Sensitivity Thermopile

THERMOPILE DETECTORS FOR GAS SENSING

TPD 2T 0625 – Dual Channel Thermopile

Applications

- Gas sensing and monitoring

Features and Benefits

- High sensitivity
- TO-39 metal housing
- Thermistor included
- Two narrow band pass filters

Product Description

This specially designed detector offers dual channel performance in a TO-39 housing with two individual optical windows. Typically one window is fitted with a reference filter G20, where as the other window is fitted with a narrow band pass filter selected for a specific gas (see page 7 of this catalog for available types). The TPD 2T 0625 is also equipped as standard with an internal thermistor as temperature reference for thermopile temperature compensation.

THERMOPILE DETECTORS FOR MEASUREMENT

TPD 1T 0214, TPD 1T 0514, TPD 1T 0624 – General-Purpose Thermopile

Applications

- Non-contact temperature measurements
- Pyrometry

Features and Benefits

- TO-39 metal housing
- Thermistor included

Product Description

This is our general-purpose range of thermopile detectors in TO-39 type housings with a round window, which also serves as an aperture. All feature a specially-designed element configuration, each one with a different size of absorbing area.

The TPD 1T 0214 provides the smallest absorbing area, the TPD 1T 0514 offers a strong signal at low sensor resistance with a large absorbing area. The TPD 1T 0624 represents a lower-cost compromise. All types are equipped as standard with an internal thermistor as temperature reference for thermopile temperature compensation.

THERMOPILE DETECTORS WITH INTEGRAL OPTICS

TPD 1T 0216 IRA, TPD 1T 0216 L5.5 – Thermopile

Applications

- Non-contact temperature measurements
- Thermometry

Features and Benefits

- TO-type metal housing
- Optics included
- Thermistor included

Product Description

The -IRA type thermopile is specially suited with an internal reflector that reduces the field of view and offers a smaller measurement “target” spot than conventional detectors without optics. Due to the reflector, the housing size is taller than other types, although the housing has the same diameter as a standard TO-39 / TO-5 housing.

The TPD 1T 0216 L5.5 offers similar benefits as the -IRA type, but has an internal lens to reduce the housing's height. The field of view of this type is sharper than for the IRA type.

Both series are equipped as standard with an internal thermistor as temperature reference for thermopile temperature compensation.

MINIATURE THERMOPILE DETECTORS FOR GAS SENSING AND MEASUREMENT

TPD 333, TPD 733 Thermopile

Applications

- Non-contact temperature measurements
- IR based gas sensors

Features and Benefits

- TO-46 metal housing
- Square window
- Optical filter options
- Thermistor included

Product Description

This is our range of general-purpose miniature thermopile detectors in 4.7 mm diameter TO-46 type housings. Both feature a specially-designed element configuration, each one with a different size of absorbing area. The window is available as standard infrared or as narrow band pass filter for gas sensing applications. The TPD 333 provides the smallest absorbing area, the TPD 733 is a larger design offering strong signals. Both types are equipped as standard with an internal thermistor as temperature reference for thermopile temperature compensation.

SMD MINIATURE THERMOPILE DETECTORS FOR ALL APPLICATIONS

THERMOPILE DETECTORS FOR MEASUREMENT ■

TPiD 1S 0121, TPiD 1S 0121 FM – Thermopile

Applications

- Ear thermometry
- General purpose temperature monitoring
- Small space applications

Features and Benefits

- Miniature SMD housing
- Flat housing
- Thermistor included
- Tape & reel

Product Description

PerkinElmer now offers thermopiles in a compact SMD housing. This enables standard SMT assembly processes and small dimensions. The SMD versions also feature the unique ISOthermal performance in thermal shock conditions as all TPiD thermopiles. It is supplied in volume in tape & reel packaging.

This sensor is equipped with an internal thermistor as temperature reference for thermopile temperature compensation.

ISOTHERMAL MINIATURE THERMOPILE DETECTORS FOR EAR THERMOMETRY

TPiD 23B, TPiD 33B Thermopile

Applications

- Ear thermometry
- General purpose thermometry

Features and Benefits

- Miniature TO-type metal housing
- Light collecting aperture
- Thermistor included

Product Description

PerkinElmer offers ear thermometry thermopiles referenced as ISOthermal detector range. The patented designs provide a superior performance of thermopiles under thermal shock conditions. The TPiD 23B is the low cost version, whereas the TPiD 33B provides higher signal. The physical dimensions of the two ISO thermal sensors are equivalent to our TO-46 sensor housings and include a special aperture. Both types are equipped with an internal thermistor as temperature reference for thermopile temperature compensation to further improve accuracy.

MINIATURE THERMOPILE DETECTORS FOR INFANT EAR THERMOMETRY

TPD 230, TPD 232 Thermopile

Applications

- Ear thermometry
- General purpose thermometry

Features and Benefits

- Miniature TO-type metal housing
- Thermistor included

Product Description

This is our range of miniature thermopile detectors tailored for infant ear thermometers. The TPD 230 is the smallest detector in a 3.56 mm diameter TO-41 housing, the TPD 232 is featured in a 4.7 mm diameter TO-46 type housing with a round window, which also serves as an aperture. Both types are equipped as standard with an internal thermistor as temperature reference for thermopile temperature compensation.

THERMOPILE SENSOR WITH INTEGRATED PROCESSING FOR NON-CONTACT TEMPERATURE MEASUREMENT

THERMOPILE SENSORS AND MODULES ■

TPS 1T 0134 ,TPS 1T 0136 L5.5, TPS 1T 0136 IRA Thermopile Sensor (TPMI® Family)

Target Applications

- General purpose temperature monitoring

Features and Benefits

- Internal signal processing
- Factory calibrated
- Optics available
- Ambient temperature compensation

Field of View

Filter

Product Description

The TPS family, as a recent upgrade to our original and popular TPMI® thermopiles, senses the thermal radiation emitted by objects and converts this to an analog voltage. It is fully factory-calibrated for accurate signal output over a specific temperature range. Further, customers may program the unit individually via the serial interface. The internal digital signal processing and 8 bit resolution of the control registers and the E2PROM technology allow for adjustment and changing of the configuration to customer requirements.

The temperature accuracy of the fully adjustable integrated circuit outperforms discrete solutions. With the integration of thermopile and electronic circuits in compact TO-39 housing, the TPS is robust and insensitive to environmental influences like leakage currents on the parent PCB, relative humidity or electromagnetic interference.

The TPMI® sensor family includes the integrated ambient temperature compensation and the calibration to a certain temperature range. Customer specific modifications are possible. Thus, when ordering, the correct temperature range needs to be specified.

For requirements of defined spot sizes, we offer sensors with defined field of view obtained by apertures, internal lenses or integrated mirrors.

For amplification of the highly sensitive thermopile signal a high resolution programmable low noise amplifier is provided. An adjustable high precision ambient temperature sensor followed by a signal processor offers accurate compensation signals with polynomial characteristics perfectly matching the thermopile output to achieve an output signal which is closely linear with object temperature. Adding these signals will result in an ambient independent object temperature signal over a large temperature range. This range can be adapted and scaled to customer requirements by means of the flexible offset and post gain adjustment.

The two configurable comparators within the TPS can be used to allow the sensor to function as a temperature-dependent switch. Threshold temperatures and the amount of hysteresis for both comparators are freely programmable.

For the various object temperature ranges we offer the following pre-calibrated sensors:

- -20 ... 60° C: TPS 1T 0134 OAA060
- -20 ... 60° C: TPS 1T 0236 IRA OAA060
- -20 ... 120° C: TPS 1T 0136 L5.5 OAA120
- -20 ... 120° C: TPS 1T 0136 L5.5 OAA120
- -20 ... 250° C: TPS 1T 0136 IRA OAA250

IRA = internal reflector. L5.5 = 5.5 mm focal length lens.

A temperature reference output is included. On request other object temperature ranges can be provided. The sensors can also be supplied as an "OBA" version without internal temperature compensation.

SMD THERMOPILE SENSOR WITH INTEGRATED PROCESSING FOR NON-CONTACT TEMPERATURE MEASUREMENT

THERMOPILE SENSORS AND MODULES ■

TPiS 1S 0133, TPiS 1S 0133 FM Thermopile Sensor

Target Applications

- General purpose temperature monitoring

Features and Benefits

- SMD housing
- Internal signal processing
- Factory calibrated
- Ambient temperature compensation

Field of View

Filter

Product Description

PerkinElmer uniquely brings an SMD housing to temperature sensors, in the form of the TPiS thermopile detector standard sensors. This SMD family also offers ISOthermal improvements due to their unique construction.

The SMD TPiS senses the thermal radiation emitted by objects and converts this to an analog voltage. It is fully factory-calibrated for an accurate signal output over a specific temperature range. The internal digital signal processing and 8 bit resolution of the control registers and the E2PROM technology allow for adjustment and changing of the configuration to customer requirements.

The temperature accuracy of the fully adjustable integrated circuit outperforms discrete solutions.

By integrating the thermopile and electronic circuit into an industry standard SMD housing, the TPiS 1S 0133 enables full automatic pick and place and soldering process of the SMD technology.

It is supplied in volume in tape & reel packaging.

The TPiS sensor includes the integrated ambient temperature compensation and the calibration to a certain temperature range. Customer specific modifications are possible. Thus, when ordering, the correct temperature range needs to be specified.

The standard configuration offers a wide field of view. For requirements of more narrow spot sizes, we offer the TPiS 1S 0133 FM version with reduced optical field of view defined by an optical aperture in the window.

For amplification of the highly sensitive thermopile signal a high resolution programmable low noise amplifier is provided. An adjustable high precision ambient temperature sensor followed by a signal processor offers accurate compensation signals with polynomial characteristics perfectly matching the thermopile output. Adding these signals results in an ambient independent object temperature signal over a large temperature range. This range can be adapted and scaled to customer requirements by means of the flexible offset and post gain adjustment.

The two configurable comparators can be used to allow the TPiS 1S 0133 sensor to function as a temperature-dependent switch. Threshold temperatures and the hysteresis for both comparators are freely programmable.

For the various object temperature ranges we offer the following pre-calibrated sensors:

- -20 ... 60° C: TPiS 1S 0133 OAA060
- -20 ... 120° C: TPiS 1S 0133 OAA120
- -20 ... 60° C: TPiS 1S 0133 FM OAA060
- -20 ... 120° C: TPiS 1S 0133 FM OAA120

A temperature reference output is included. On request other object temperature ranges can be provided. The sensors can also be supplied as an "OBA" version without internal temperature compensation.

THERMOPILE MODULE WITH INTEGRATED PROCESSING FOR TEMPERATURE MEASUREMENT

TPM 1T 0136 L5.5, TPM 1T 0134 M(y) – Thermopile Module (TPMI®)

Target Applications

- General purpose temperature monitoring

Features and Benefits

- Internal signal processing
- Factory calibrated
- Lens or mirror optics
- Ambient temperature compensation

Field of View

Filter

Product Description

The module range of PerkinElmer consists of a thermopile sensor mounted on a PCB with a connector. The PCB can also provide for optional features such as voltage regulation and a noise-reduction filter. The module includes the integrated temperature compensation for a defined temperature environment and the calibration to a certain object temperature range. Modules cannot be programmed individually at the customer site. Thus, when ordering, the correct ambient and object temperature ranges need to be specified.

For requirements of defined spot sizes, we offer sensors with a field of view defined by optical apertures, internal lenses or external mirror optics. The mirror orientation M(y) can be specified and a protective external filter may be supplied with the module.

The module types are available with different versions of pcb P(x). For the external mirror version, we supply the mirror in different viewing orientations M(y); y = L (left) / y = F (front) / y = R (right). Customization: As the modules are always calibrated to target temperature range customized versions are available.

For the various object temperature ranges we offer the following pre-calibrated modules:

External mirror types

- -20 ... 60°C: TPM 1T 0234 OAA060 P(x) M(y)
- -20 ... 140°C: TPM 1T 0134 OAA140 P(x) M(y)
- -20 ... 250°C: TPM 1T 0134 OAA250 P(x) M(y)
- -20 ... 180°C: TPM 1T 0134 OAA180 P(x) M(y)

Integral lens types

- -20 ... 60°C: TPM 1T 0236 L5.5 OAA060 P7
- -20 ... 120°C: TPM 1T 0136 L5.5 OAA120 P7
- -20 ... 180°C: TPM 1T 0136 L5.5 OAA180 P7
- -20 ... 250°C: TPM 1T 0136 L5.5 OAA250 P7
- -20 ... 300°C: TPM 1T 0136 L5.5 OAA300 P7

A temperature reference output is included. On request the modules can be supplied as an "OBA" version, which is calibrated but without internal temperature compensation. In this case the customer will do the temperature compensation externally with the use of the supplied reference output.

COOL EYE™ THERMOPILE ARRAY MODULES WITH INTEGRAL OPTICS FOR SAFETY AND SECURITY

COOL EYE THERMOPILE ARRAY MODULES ■

TPL 08T 2146 L3.9, TPL 16T 3246 L3.9 G10 – Thermopile Line, TPA 16T 4146 L3.9 Thermopile Array “Cool Eye”

Target Applications

- Presence detection
- Non-contact temperature measurement
- Temperature dependent switch for alarm or thermostatic applications
- Household appliances like microwave oven, toaster, hair dryer

Features and Benefits

- Digital SMBus interface
- Factory calibration
- Temperature signal
- Ambient temperature output signal
- Programmable emissivity
- Noise reduction filter
- Module with connector
- E2PROM configuration and data storage
- Optics included, various viewing angles
- Can be adapted to your specific requirements

Product Description

With the Cool Eye™ family PerkinElmer offers thermopile arrays in various configurations. All are module types on a PCB with communication interface and a 4-pin connector. For line arrays, we offer 8 elements and 16 elements in two different lens configurations, with 3.9 mm focus and 5.5 mm focus. The spatial design provides for 4 x 4 elements and comes with recommended 3.9 mm or 5.5 mm focal length optics.

The thermopile line or array modules consist of a 1 x 8, 1 x 16 or 4 x 4 element thermopile chip connected to an integrated multiplexing and signal conditioning circuit, E2PROM and microcontroller with an integrated A/D converter for signal processing and interfacing. Lenses for different field of views are available on demand. The sensor is equipped with an internal reference temperature sensor for correct target temperature determination.

The temperature accuracy by digital signal processing in combination with the numeric ambient temperature compensation algorithm outperforms any discrete solution. The sensor module provides an output signal which is representing real temperature data for each pixel.

Customer specific modifications are possible.

For the various object temperature ranges we offer the following pre-calibrated modules:

L3.9 types

- 0...60°C: TPL 08T 2146 L3.9 OAA060
- 0...60°C: TPL 16T 3246 L3.9 G10 OAA060
- 0...60°C: TPA 16T 4146 L3.9 OAA060

L5.5 types

- 0...150°C: TPL 08T 2146 L5.5 OAA150
- 0...60°C: TPA 16T 4146 L5.5 OAA060

Customization: As the modules are always calibrated to target temperature range customized versions are available.

A temperature reference output is included. On request the modules can be supplied as an “OBA” version, which is calibrated but without internal temperature compensation. In this case the customer will do the temperature compensation externally with the use of the supplied reference output.

Handling and Precautions

Humidity

All our IR-detectors shall not increase noise or decrease responsivity when exposed to $\leq 95\%$ R.H. at 30°C . Operation below dew point (i.e. with condensation) might affect performance.

Hermetic seal

All our IR-detectors are sealed to pass a He-leakage test with maximum leak rate of $5 \times 10^{-8} \text{ mbar.l.s}^{-1}$.

Quality

PerkinElmer is a QS 9000 certified manufacturer with established SPC and TQM. Detector outgoing inspections include the parameters Responsivity, Match, Offset, Noise, Gross leak (Mil Std 883 method 1014C1). Individual data are not stored, statistical details can be disclosed on request.

Handling

Electrostatic charges may destroy the detector. We recommend applying precautions necessary for ESD devices to avoid damages. Do not apply physical force to detector leads. Do not expose detector to aggressive detergents such as freon, trichloroethylene, etc.

Soldering conditions

Hand soldering and standard wave soldering process may be applied. Avoid heat exposure to the top and the window of the detector. Reflow soldering is not recommended for all TO-housing types. Our new SMD types are designed for reflow-soldering in accordance with general practices for SMD.

Typical Lead Free Reflow Profile

Reliability Standards

International Electrotechnical Commission (IEC) Standards

IEC 60068-2-1	Environmental testing – Part 2: Tests. Tests A: Cold
IEC 60068-2-2	Environmental testing - Part 2: Tests. Tests B: Dry heat
IEC 60068-2-78	Environmental testing - Part 2-78: Tests - Test Cab: Damp heat, steady state
IEC 60068-2-14	Environmental testing - Part 2: Tests. Test N: Change of temperature

Joint Electron Devices Engineering (JEDEC) Standards

JESD-22	Series test methods
---------	---------------------

US Military (MIL) Standards

MIL-STD-883	Test methods and procedures for microelectronics
-------------	--

Soldering of SMD Devices

The TPID 1S 0121 and TPiS 1S series are lead-free components and fully comply with the RoHS regulations, especially with existing roadmaps of lead-free soldering. Reflow soldering is recommended. A typical lead-free reflow profile is shown in above graph. Specific reflow soldering parameters depend on the solder alloy used. The device meets MSL3 at 245°C according to JEDEC standard.

Reliability Standards

PerkinElmer's continuous reliability qualification and monitoring program ensures that all outgoing products meet quality and reliability standards. Tests are performed according to approved semiconductor device standards, such as IEC, MIL, and JEDEC (see table). For detailed information please contact PerkinElmer.
